Further dynamics Exercise A, Question 1

Question:

A particle P of mass 0.2 kg is moving on the x-axis. At time t seconds P is x metres from the origin O. The force acting on P has magnitude $2\cos t$ N and acts in the direction OP. When t=0, P is at rest at O. Calculate

- a the speed of P when t=2,
- **b** the speed of P when t=3,
- c the time when P first comes to instantaneous rest,
- d the distance OP when t = 2,
- e the distance OP when P first comes to instantaneous rest.

Solution:

F = maa $2\cos t = 0.2a$ $0.2 \frac{dv}{dt} = 2\cos t - \frac{dv}{dt}$ Force is a function of time so use a = $v = \frac{2}{0.2} \int \cos t \, dt$ Integrate to obtain an expression for v. $v = 10\sin t + c$ $t = 0 \ \nu = 0$ Don't forget the constant. 0 = 0 + c : c = 0 $v = 10 \sin t$

$$t = 2$$
 $v = 10 \sin 2 = 9.092...$

When t = 2 the speed of P is 9.09 m s⁻¹ (3 s.f.)

b t=3 $v=10\sin 3=1.411...$

When t=3 the speed of P is $1.41 \,\mathrm{m \ s^{-1}}$ (3 s.f.)

c
$$v = 0$$
 $0 = 10 \sin t$ P comes to rest when $v = 0$.
$$\sin t = 0$$

Integrate to obtain an expression

for x.

 $t = 0, \pi, ...$

P first comes to rest when $t = \pi$. Exact answers are best.

 $v = 10 \sin t$ d

$$\frac{\mathrm{d}x}{\mathrm{d}t} = 10\sin t$$

$$x = 10 \int \sin t \, dt$$

$$x = -10 \cos t + K$$

$$t = 0, x = 0 \quad 0 = -10 + K \therefore K = 10$$

t = 0, x = 0 0 = -10 + K. K = 10

 $x = -10\cos t + 10$

t = 2 $x = -10\cos t + 10 = 14.16...$

When t = 2 OP = 14.2 m (3 s.f.)

e
$$t = \pi$$
 $x = -10 \cos \pi + 10$
= $10 + 10 = 20$
When P comes to rest $OP = 20$ m.

Further dynamics Exercise A, Question 2

Question:

A van of mass 1200 kg moves along a horizontal straight road. At time t seconds, the resultant force acting on the car has magnitude $\frac{60\,000}{\left(t+5\right)^2}\,\mathrm{N}$ and acts in the direction of

motion of the van. When t=0, the van is at rest. The speed of the van approaches a limiting value $V = s^{-1}$. Find

- a the value of V,
- b the distance moved by the van in the first 4 seconds of its motion.

Solution:

a
$$F = ma$$

$$\frac{60\,000}{(t+5)^2} = 1200a$$

$$a = \frac{50}{(t+5)^2}$$

$$\frac{dv}{dt} = \frac{50}{(t+5)^2}$$

$$v = \int \frac{50}{(t+5)^2} dt$$
Force is a function of time so use $a = \frac{dv}{dt}$.

$$v = -\frac{50}{(t+5)} + c$$

$$t = 0, v = 0 \quad \therefore 0 = -\frac{50}{5} + c$$

$$c = 10$$

$$v = -\frac{50}{t+5} + 10$$
As $t \to \infty - \frac{50}{t+5} \to 0$

$$\therefore V = 10$$

$$v = -\frac{50}{t+5} + 10$$

$$\frac{dx}{dt} = -\frac{50}{t+5} + 10$$

$$x = -50\ln(t+5) + 10t + K$$

$$t = 0, x = 0 \quad 0 = -50\ln 5 + K$$

$$K = 50\ln 5$$

$$\therefore x = -50\ln(t+5) + 10t + 50\ln 5$$

$$t = 4 \quad x = -50\ln(t+5) + 10t + 50\ln 5$$

$$t = 4 \quad x = -50\ln 9 + 40 + 50\ln 5$$

$$x = 40 + 50\ln \frac{5}{9}$$

$$x = 10.61...$$
The van moves 10.6 m in the first 4 seconds (3 s.f.)

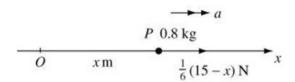

Further dynamics Exercise A, Question 3

Question:

A particle P of mass 0.8 kg is moving along the x-axis. At time t=0, P passes through the origin O, moving in the positive x direction. At time t seconds, OP = x metres and the velocity of P is v m s⁻¹. The resultant force acting on P has magnitude $\frac{1}{6}(15-x)N$, and acts in the positive x direction. The maximum speed of P is $12 \, \mathrm{m \, s^{-1}}$.

- a Explain why the maximum speed of P occurs when x = 15.
- **b** Find the speed of P when t = 0.

Solution:

a Maximum speed ⇒ acceleration zero ⇒ force is zero

$$\therefore \frac{1}{6}(15-x)=0 \therefore x=15$$

$$\mathbf{b}$$
 $F = ma$

$$\frac{1}{6}(15-x) = 0.8a$$

$$a = \frac{1}{4.8}(15-x)$$

$$v \frac{dv}{dx} = \frac{1}{4.8}(15-x)$$
Force is a function of x so use $a = v \frac{dv}{dx}$.
$$\int v \, dv = \frac{1}{4.8} \int (15-x) \, dx$$

$$\frac{1}{2}v^2 = \frac{1}{4.8} \left(15x - \frac{1}{2}x^2\right) + c$$
Separate the variables.

$$x = 15, v = 12$$

$$\frac{1}{2} \times 12^{2} = \frac{1}{4.8} \left(15 \times 15 - \frac{1}{2} \times 15^{2} \right) + c$$

$$c = \frac{1}{2} \times 12^{2} - \frac{1}{4.8} \times \frac{1}{2} \times 15^{2}$$

$$c = 48.5625$$

$$\frac{1}{2} v^{2} = \frac{1}{4.8} \left(15x - \frac{1}{2}x^{2} \right) + 48.5625$$

$$t = 0, x = 0 \quad v^{2} = 2 \times 48.5625$$

$$v = 9.855$$

A tells you the initial conditions.

P is at 0 when $t = 0$.

When t = 0 P's speed is 9.86 m s⁻¹ (3 s.f.)

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise A, Question 4

Ouestion:

A particle P of mass 0.75 kg is moving in a straight line. At time t seconds after it passes through a fixed point on the line, O, the distance OP is x metres and the force acting on P has magnitude $\left(2e^{-x}+2\right)N$ and acts in the direction OP. Given that P

passes through O with speed $5 \,\mathrm{m \ s^{-1}}$, calculate the speed of P when

a
$$x=3$$
.

b
$$x = 7$$
.

Solution:

$$0.75 \text{ kg} \qquad \ddot{x}$$

$$F = ma$$

$$(2e^{-x} + 2) = 0.75\ddot{x}$$

$$0.75\nu \frac{d\nu}{dx} = 2e^{-x} + 2 \qquad \text{Force is a function of } x \text{ so use } \ddot{x} = \nu \frac{d\nu}{dx}.$$

$$0.75 \int \nu \, d\nu = \int (2e^{-x} + 2) \, dx \qquad \text{Separate the variables.}$$

$$0.75 \times \frac{1}{2}\nu^2 = -2e^{-x} + 2x + c$$

$$x = 0, \nu = 5 \therefore 0.75 \times \frac{1}{2} \times 5^2 = -2 + c$$

$$c = 0.75 \times \frac{1}{2} \times 5^2 + 2 = 11.375$$

$$\therefore 0.375\nu^2 = -2e^{-x} + 2x + 11.375$$

a
$$x = 3$$

$$v^2 = \frac{1}{0.375} (-2e^{-3} + 6 + 11.375)$$

$$v = 6.787...$$
When $x = 3$ P's speed is 6.79 m s⁻¹ (3 s.f.)

b
$$x = 7$$
 $v^2 = \frac{1}{0.375}(-2e^{-7} + 14 + 11.375)$

When x = 7 P's speed is $8.23 \,\mathrm{m \ s^{-1}} (3 \,\mathrm{s.f.})$

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise A, Question 5

Ouestion:

A particle P of mass 0.5 kg moves away from the origin O along the positive x-axis. When OP = x metres the force acting on P has magnitude $\frac{3}{x+2}N$ and is directed away from O. When x = 0 the speed of P is $1.5 \,\mathrm{m \ s^{-1}}$. Find the value of x when the speed of P is $2 \,\mathrm{m \ s^{-1}}$.

Solution:

Force is a function of
$$x$$
 so use $\bar{x} = v \frac{dv}{dx}$.

$$F = ma$$

$$\frac{3}{x+2} = 0.5\bar{x}$$

$$0.5v \frac{dv}{dx} = \frac{3}{x+2}$$

$$0.5 \int v \, dv = 3 \int \frac{1}{x+2} \, dx$$

$$0.5x \frac{1}{2}v^2 = 3\ln(x+2) + c$$

$$x = 0, v = 1.5$$

$$0.5x \frac{1}{2}x \cdot 1.5^2 = 3\ln 2 + c$$

$$c = \frac{1.5^2}{4} - 3\ln 2$$
For the best final answer keep the exact value as long as possible.

$$v = 2 \quad \frac{1}{4}v^2 = 3\ln(x+2) + \frac{1.5^2}{4} - 3\ln 2$$

$$v = 2 \quad \frac{1}{4}x^2 = 3\ln(x+2) + \frac{1.5^2}{4} - 3\ln 2$$

$$3\ln(x+2) = 1 - \frac{1.5^2}{4} + 3\ln 2$$

$$\ln(x+2) = 0.8389...$$

$$x = e^{0.8389...} - 2 = 0.3140...$$

When P's speed is 2 m s^{-1} , x = 0.314 (3 s.f.)

Further dynamics Exercise A, Question 6

Question:

Calculate the magnitude of the impulse of a force of magnitude F N acting from time t_1 seconds to time t_2 seconds where

a
$$F = 3t^2 - \frac{1}{2}t$$
 $t_1 = 0, t_2 = 4$,

b
$$F = 2t + \frac{1}{3t-2}$$
 $t_1 = 1, t_2 = 2$,

$$\mathbf{c} \quad F = 2\cos 4t \quad t_1 = 0, \, t_2 = \frac{\pi}{4} \, ,$$

d
$$F = 3 + e^{-0.5t}$$
 $t_1 = 0, t_2 = 4$.

Solution:

a Impulse =
$$\int_{0}^{4} \left(3t^{2} - \frac{1}{2}t\right) dt$$
=
$$\left[t^{3} - \frac{1}{4}t^{2}\right]_{0}^{4}$$
=
$$64 - 4 - 0 = 60$$
Impulse =
$$\int_{t_{1}}^{t_{2}} F dt \text{ or see end for an alternative method.}$$

The magnitude of the impulse is 60 Ns.

b Impulse
$$= \int_{1}^{2} \left(2t + \frac{1}{3t - 2} \right) dt$$

$$= \left[t^{2} + \frac{1}{3} \ln(3t - 2) \right]_{1}^{2}$$

$$= 4 + \frac{1}{3} \ln(6 - 2) - \left(1 + \frac{1}{3} \ln 1 \right)$$

$$= 3 + \frac{1}{3} \ln 4$$

$$= 3.462...$$

The magnitude of the impulse is 3.46 Ns (3 s.f.)

c Impulse
$$= \int_0^{\frac{\sigma}{4}} 2\cos 4t \, dt = \left[\frac{2}{4}\sin 4t\right]_0^{\frac{\sigma}{4}}$$
$$= \frac{1}{2} \left[\sin \pi - \sin 0\right]$$
$$= 1$$

The magnitude of the impulse is 1 Ns

d Impulse =
$$\int_0^4 (3 + e^{-0.5t}) dt$$
=
$$\left[3t - 2e^{-0.5t} \right]_0^4$$
=
$$12 - 2e^{-2} - (0 - 2 \times 1)$$
=
$$14 - 2e^{-2}$$
=
$$13.72...$$

The magnitude of the impulse is 13.7 Ns (3 s.f.)

Alternative method for a

From a Transfer method for a
$$F = ma$$
 Use $F = ma$ to find mv at each of the required times.

$$t^3 - \frac{t^2}{4} + c = mv$$

$$t = 0 \quad mv_1 = c$$

$$t = 4 \quad 64 - 4 + c = mv_2$$
impulse $= mv_2 - mv_1$

$$= 60 + c - c = 60$$

Impulse $= change in momentum$.

The magnitude of the impulse is 60 Ns.

Further dynamics Exercise A, Question 7

Question:

Calculate the work done by a force of magnitude F N directed along the x-axis which moves a particle from $x = x_1$ metres to $x = x_2$ metres where

a
$$F = 2x^{\frac{1}{2}} + \frac{1}{2}x^2$$
 $x_1 = 1, x_2 = 4$,

b
$$F = 2 \sin x + 3$$
 $x_1 = 0$, $x_2 = \frac{\pi}{2}$,

$$c F = 3x^2 + e^{-2x} x_1 = 1, x_2 = 3,$$

d
$$F = \frac{3}{x} + \frac{2}{x-1}$$
 $x_1 = 2$, $x_2 = 4$.

Solution:

a work done =
$$\int_{1}^{4} \left(2x^{\frac{1}{2}} + \frac{1}{2}x^{2}\right) dx$$
 work done = $\int_{x_{1}}^{x_{2}} F ds$ or see for $= \left[\frac{4}{3}x^{\frac{3}{2}} + \frac{1}{6}x^{3}\right]_{1}^{4}$ an alternative method.

$$= \frac{4}{3} \times 8 + \frac{1}{6} \times 64 - \left(\frac{4}{3} + \frac{1}{6}\right)$$

$$= 19\frac{5}{6} \text{ (or 19.83...)}$$

The work done is $19\frac{5}{6}$ J (or 19.8 J (3 s.f.))

b work done =
$$\int_0^{\frac{\pi}{2}} (2\sin x + 3) dx$$

= $[-2\cos x + 3x]_0^{\frac{\pi}{2}}$
= $-2\cos\frac{\pi}{2} + \frac{3\pi}{2} - (-2\cos 0 + 0)$
= $\frac{3\pi}{2} + 2$
The work done is $(\frac{3\pi}{2} + 2)$ J or 6.71 J (3 s.f.)

Give the exact answer unless accuracy is specified.

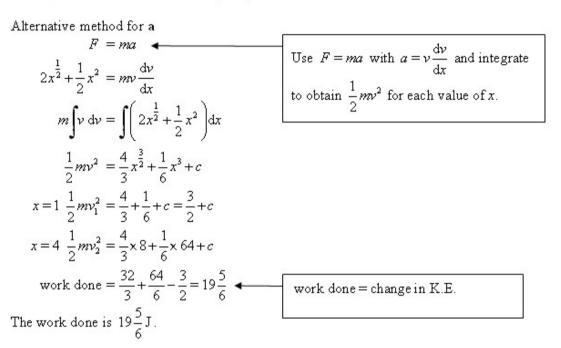

c Work done =
$$\int_{1}^{3} (3x^{2} + e^{-2x}) dx$$

= $\left[x^{3} - \frac{1}{2} e^{-2x} \right]_{1}^{3}$
= $27 - \frac{1}{2} e^{-6} - \left(1 - \frac{1}{2} e^{-2} \right)$
= $26.06...$

The work done is 26.1 J (3 s.f.)

d Work done =
$$\int_{2}^{4} \left(\frac{3}{x} + \frac{2}{x-1}\right) dx$$
=
$$\left[3\ln x + 2\ln(x-1)\right]_{2}^{4}$$
=
$$3\ln 4 + 2\ln 3 - (3\ln 2 + 2\ln 1)$$
=
$$\ln 64 + \ln 9 - \ln 8 - 0$$
=
$$\ln\left(\frac{64 \times 9}{8}\right) = \ln 72$$

The work done is ln 72 J or 4.28 J (3 s.f.)

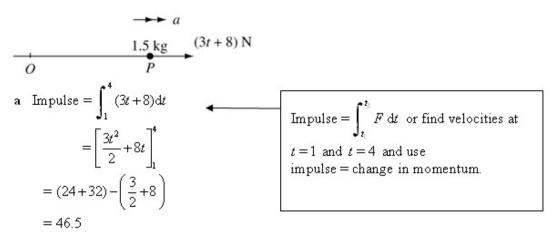

Further dynamics Exercise A, Question 8

Question:

A particle P of mass 1.5 kg is moving in a straight line. The particle is initially at rest at a point O on the line. At time t seconds (where $t \ge 0$) the force acting on P has magnitude (3t+8)N and acts in the direction OP. When t=T, P has speed 75 m s⁻¹. Calculate

- a the magnitude of the impulse exerted by the force between the times t=1 and t=4.
- **b** the speed of P when t=3,
- c the value of T.

Solution:

The impulse has magnitude 46.5 Ns.

b
$$F = ma$$

$$3t + 8 = 1.5a$$

$$\frac{3}{2} \frac{dv}{dt} = 3t + 8$$

$$\frac{3}{2}v = \int (3t + 8)dt$$

$$\frac{3}{2}v = \frac{3t^2}{2} + 8t + c$$

$$t = 0 v = 0 \Rightarrow c = 0$$

$$t = 3\frac{3}{2}v = \frac{27}{2} + 24$$

$$v = \frac{2}{3}x\frac{75}{2}$$

$$v = 25$$

When t=3 the speed of P is 25 m s^{-1} .

c
$$\frac{3}{2}v = \frac{3t^2}{2} + 8t$$

$$v = 75, t = T$$

$$\frac{3}{2} \times 75 = \frac{3T^2}{2} + 8T$$

$$3T^2 + 16T - 225 = 0$$

$$T = \frac{-16 \pm \sqrt{(16^2 + 4 \times 3 \times 225)}}{6}$$

$$= 6.394... \text{ or } -11.72...$$

$$T > 0 \therefore T = 6.39 \text{ (3 s.f.)}$$

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise A, Question 9

Ouestion:

A particle of mass 0.6 kg moves in a straight line through a fixed point O. At time t seconds after passing through O the distance of P from O is x metres and the acceleration of P is $\frac{1}{5}(x^2+2x)$ m s⁻².

- a Write down, in terms of x, an expression for the force acting on P.
- **b** Calculate the work done by the force in moving P from x = 0 to x = 4.

Solution:

The work done is 4.48 J.

Further dynamics Exercise B, Question 1

Ouestion:

Above the Earth's surface, the magnitude of the force on a particle due to the Earth's gravitational force is inversely proportional to the square of the distance of the particle from the centre of the Earth. The acceleration due to gravity on the surface of the Earth is g and the Earth can be modelled as a sphere of radius R. A particle P of mass m is a distance (x-R) (where $x \ge R$) above the surface of the Earth. Prove that the

magnitude of the gravitational force acting on P is $\frac{mgR^2}{\pi^2}$.

Solution:

$$F = \frac{k}{d^2}$$
 where $d = \text{distance from centre}$
distance $(x - R)$ above surface
 \Rightarrow distance x from centre

⇒ distance x from centre

$$F = \frac{k}{x^2}$$
On surface $F = mg, x = R$

$$mg = \frac{k}{R^2}$$

$$k = mgR^2$$

 \therefore Magnitude of the gravitational force is $\frac{mgR^2}{r^2}$.

The magnitude of the gravitational force on a particle on the surface of the earth is the magnitude of the weight of the particle.

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise B, Question 2

Question:

The Earth can be modelled as a sphere of radius R. At a distance x (where $x \ge R$) from the centre of the Earth the magnitude of the acceleration due to the Earth's gravitational force is A. On the surface of the Earth, the magnitude of the acceleration

due to the Earth's gravitational force is g. Prove that $A = \frac{gR^2}{x^2}$.

Solution:

For a particle of mass m, distance x from the centre of the earth:

$$F = ma$$

$$\frac{k}{x^2} = mA$$

•---

Use the inverse square law.

On the surface of the earth, x = R, A = g

$$\therefore mg = \frac{k}{R^2}$$

$$k = mgR^2$$

$$\therefore mA = \frac{mgR^2}{x^2}$$

$$A = \frac{gR^2}{x^2}$$

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise B, Question 3

Ouestion:

A spacecraft S is fired vertically upwards from the surface of the Earth. When it is at a height R, where R is the radius of the Earth, above the surface of the Earth its speed is \sqrt{gR} . Model the spacecraft as a particle and the Earth as a sphere of radius R and find, in terms of g and R, the speed with which S was fired. (You may assume that air resistance can be ignored and that the rocket's engine is turned off immediately after the rocket fired.)

Solution:

$$F = ma$$

$$\frac{mgR^2}{x^2} = -m\ddot{x}$$
S is moving away from the earth, so the acceleration is in the direction of decreasing x.

where x is the distance of S from the centre of the Earth.

$$v \frac{dv}{dx} = -g \frac{R^2}{x^2}$$

$$\int v \, dv = -g \, R^2 \int \frac{1}{x^2} \, dx$$
Use $\ddot{x} = v \frac{dv}{dx}$ as the acceleration is a function of x .

$$\frac{1}{2}v^2 = g\frac{R^2}{x} + C$$

$$x = 2R \quad v = \sqrt{gR}$$

$$\frac{1}{2}gR = \frac{gR^2}{2R} + C$$

$$C = 0$$

$$\frac{1}{2}v^2 = \frac{gR^2}{x}$$

$$x = R \quad \frac{1}{2}v^2 = \frac{gR^2}{R}$$

$$v^2 = 2gR$$

$$v = \sqrt{2gR}$$

S was fired with speed $\sqrt{2gR}$.

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise B, Question 4

Ouestion:

A rocket of mass m is fired vertically upwards from the surface of the Earth with initial speed U. The Earth is modelled as a sphere of radius R and the rocket as a particle. Find an expression for the speed of the rocket when it has travelled a distance X metres. (You may assume that air resistance can be ignored and that the rocket's engine is turned off immediately after the rocket is fired.)

Solution:

$$F = ma$$

$$\frac{mg R^2}{x^2} = -m\ddot{x}$$
The acceleration is in the direction of decreasing x.

where x is the distance of the rocket from the centre of the Earth.

$$v\frac{dv}{dx} = -\frac{gR^2}{x^2}$$

$$\int v \, dv = -gR^2 \int \frac{1}{x^2} \, dx$$

$$\frac{1}{2}v^2 = \frac{gR^2}{x} + C$$

$$x = R, \quad v = U$$

$$C = \frac{1}{2}U^2 - gR$$

$$x = (X + R)$$

$$x = (X + R)$$

$$v^2 = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 - gR$$

$$x = \frac{gR^2}{(X + R)} + \frac{1}{2}U^2 -$$

When it has travelled X metres, the speed of the rocket is $\sqrt{\left[\frac{U^2X+U^2R-2g\ RX}{(X+R)}\right]}$

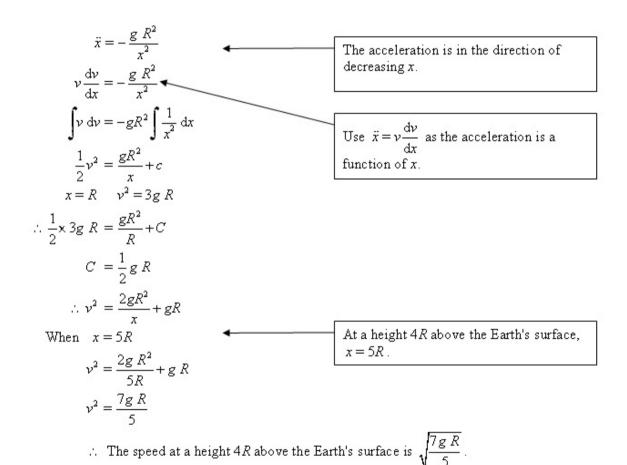

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise B, Question 5

Ouestion:

A particle is fired vertically upwards from the Earth's surface. The initial speed of the particle is u where $u^2 = 3gR$ and R is the radius of the Earth. Find, in terms of g and R, the speed of the particle when it is at a height 4R above the Earth's surface. (You may assume that air resistance can be ignored.)

Solution:

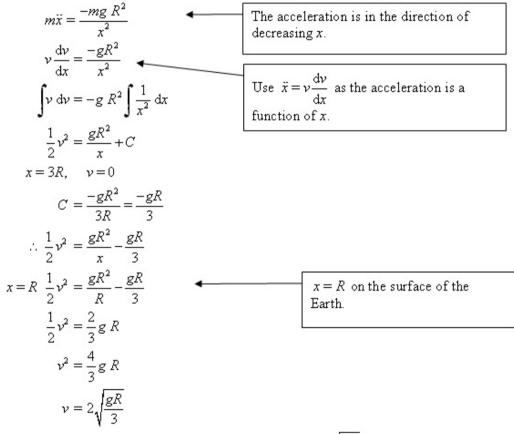

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise B, Question 6

Ouestion:

A particle is moving in a straight line towards the centre of the Earth, which is assumed to be a sphere of radius R. The particle starts from rest when its distance from the centre of the Earth is 3R. Find the speed of the particle as it hits the surface of the Earth. (You may assume that air resistance can be ignored.)

Solution:

The particle hits the surface of the Earth with speed $2\sqrt{\frac{gR}{3}}$.

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise C, Question 1

Question:

A particle P is moving in a straight line with simple harmonic motion. The amplitude of the oscillation is 0.5 m and P passes through the centre of the oscillation O with speed 2 m s⁻¹. Calculate

- a the period of the oscillation,
- **b** the speed of P when $OP = 0.2 \,\mathrm{m}$.

Solution:

a
$$v^2 = \omega^2(a^2 - x^2)$$

 $a = 0.5$, $x = 0$ $v = 2$
 $2^2 = \omega^2 \times 0.5^2$
 $\omega = \frac{2}{0.5} = 4$
period = $\frac{2\pi}{\omega} = \frac{2\pi}{4} = \frac{\pi}{2}$
The period is $\frac{\pi}{2}$ s.

b
$$x = 0.2 \,\text{m}$$
 $v^2 = 4^2 (0.5^2 - 0.2^2)$ $v = 1.833...$

When OP = 0.2 m the speed of P is 1.83 m s^{-1} (3 s.f.)

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise C, Question 2

Question:

A particle P is moving in a straight line with simple harmonic motion. The period is

 $\frac{\pi}{3}$ s and P's maximum speed is 6 m s⁻¹. The centre of the oscillation is O. Calculate

- a the amplitude of the motion,
- b the speed of P 0.3s after passing through O.

Solution:

a period =
$$\frac{2\pi}{\omega} = \frac{\pi}{3}$$

 $\therefore \omega = 6$
 $v^2 = \omega^2(a^2 - x^2)$
 $6^2 = 6^2(a^2 - 0^2)$
 $\therefore a = 1$
The amplitude is 1 m.

Maximum speed occurs when $x = 0$.

Maximum speed occurs when $x = 0$.

The speed 0.3 s after passing 0 is required.

 $t = 0.3s$ $v = 1x 6 \cos(6x 0.3)$
 $v = 6 \cos 1.8$
 $v = -1.363$

When $t = 0.3$, P has speed 1.36 m s⁻¹ (3 s.f.)

Speed is positive.

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise C, Question 3

Ouestion:

A particle is moving in a straight line with simple harmonic motion. Its maximum speed is 10 m s⁻¹ and its maximum acceleration is 20 m s⁻². Calculate

2

- a the amplitude of the motion,
- b the period of the motion.

Solution:

 $v^2 = \omega^2 (a^2 - x^2)$ x = 0, $v = 10 \text{ m s}^{-1}$ $10^2 = \omega^2 \alpha^2$ $\ddot{x} = -\omega^2 x$ $x = -\alpha$, $\ddot{x} = 20 \text{ m s}^{-2}$ $20 = +\omega^2 a$

Maximum speed occurs when x = 0.

a = 5

Maximum acceleration occurs when x = -a.

The amplitude is 5 m.

b Using $\oplus 10 = a\omega$ $10 = 5\omega$ $\omega = 2$ period = $\frac{2\pi}{}$ = π

The period is π s.

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise C, Question 4

Question:

A particle is moving in a straight line with simple harmonic motion. The period of the motion is $\frac{3\pi}{5}$ s and the amplitude is 0.4 m. Calculate the maximum speed of the particle.

Solution:

period =
$$\frac{2\pi}{\omega} = \frac{3\pi}{5}$$

 $\omega = \frac{10}{3}$
 $v^2 = \omega^2(a^2 - x^2)$
 $v^2 = \left(\frac{10}{3}\right)^2(0.4^2 - 0)$

$$v = \frac{10}{3} \times 0.4 = \frac{4}{3}$$
The maximum speed is $\frac{4}{3}$ m s⁻¹.

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise C, Question 5

Ouestion:

A particle is moving in a straight line with simple harmonic motion. Its maximum acceleration is 15 m s⁻² and its maximum speed is 18 m s⁻¹. Calculate the speed of the particle when it is 2.5 m from the centre of the oscillation.

Solution:

$$\ddot{x} = -\omega^{2}x$$

$$\ddot{x} = 15 \text{ m s}^{-2}, x = a$$

$$15 = \omega^{2}a \qquad \textcircled{0}$$

$$v^{2} = \omega^{2}(a^{2} - x^{2}) \qquad \text{First find } a \text{ and } \omega \text{. (See question 3.)}$$

$$\textcircled{2} \div \textcircled{0} \qquad \frac{18^{2}}{15} = \frac{\omega^{2}a^{2}}{\omega^{2}a}$$

$$a = \frac{18^{2}}{15} = 21.6$$
Using \(\textcircled{0}\) $a\omega = 18$

$$\omega = \frac{18}{21.6} = 0.8333...$$

$$v^{2} = \omega^{2}(a^{2} - x^{2})$$

$$v^{2} = 0.8333...^{2}(21.6^{2} - 2.5^{2})$$

$$v = 17.87...$$
The speed is $17.9 \text{ m s}^{-1}(3 \text{ s.f.})$

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise C, Question 6

Question:

A particle P is moving in a straight line with simple harmonic motion. The centre of the oscillation is O and the period is $\frac{\pi}{2}$ s. When OP = 1.2 m, P has speed 1.5 m s^{-1} .

a Find the amplitude of the motion.

At time t seconds the displacement of P from O is x metres. When t = 0, P is passing through O.

b Find an expression for x in terms of t.

Solution:

a period =
$$\frac{2\pi}{\omega} = \frac{\pi}{2}$$

 $\omega = 4$
 $v^2 = \omega^2(a^2 - x^2)$
 $x = 1.2 \text{ m}$ $v = 1.5 \text{ m s}^{-1}$
 $1.5^2 = 4^2(a^2 - 1.2^2)$
 $a^2 = \frac{1.5^2}{4^2} + 1.2^2$
 $a = 1.257...$

Use the period to find ω .

Then use $v^2 = \omega^2(a^2 - x^2)$ with $x = 1.2$ and $v = 1.5$ to find a .

The amplitude is 1.26 m (3 s.f.).

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise C, Question 7

Ouestion:

A particle is moving in a straight line with simple harmonic motion. The particle performs 6 complete oscillations per second and passes through the centre of the oscillation, O, with speed $5 \,\mathrm{m \ s^{-1}}$. When P passes through the point A the magnitude of P's acceleration is $20 \,\mathrm{m \ s^{-1}}$. Calculate

- a the amplitude of the motion,
- b the distance OA.

Solution:

a period = $\frac{2\pi}{\omega} = \frac{1}{6}$ $\omega = 12\pi$ $v^2 = \omega^2 (a^2 - x^2)$ $5^2 = (12\pi)^2 (a^2 - 0)$ $a = \frac{5}{12\pi} = 0.1326...$ The amplitude is 0.133 m (3 s.f.).

The period is the time for one complete oscillation.

b $\ddot{x} = -\omega^2 x$ $20 = |-12\pi^2| x$ $x = \frac{20}{12\pi^2}$ x = 0.01407...OA = 0.0141 m (3 s.f.)

You are told the magnitude of the acceleration at A.

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise C, Question 8

Ouestion:

A particle P is moving on a straight line with simple harmonic motion between two points A and B. The mid-point of AB is O. When OP = 0.6 m, the speed of P is

 3 m s^{-1} and when OP = 0.2 m the speed of P is 6 m s^{-1} . Find

- a the distance AB,
- b the period of the motion.

Solution:

a
$$v^2 = \omega^2 (a^2 - x^2)$$

 $x = 0.6 \,\mathrm{m}, v = 3 \,\mathrm{m} \,\mathrm{s}^{-1}$
 $3^2 = \omega^2 (a^2 - 0.6)^2$ ①
 $x = 0.2 \,\mathrm{m}, v = 6 \,\mathrm{m} \,\mathrm{s}^{-1}$
 $6^2 = \omega^2 (a^2 - 0.2)^2$ ②
② ÷ ① $\frac{6^2}{3^2} = \frac{\omega^2 (a^2 - 0.2^2)}{\omega^2 (a^2 - 0.6^2)}$
 $4(a^2 - 0.6^2) = a^2 - 0.2^2$
 $3a^2 = 4 \times 0.6^2 - 0.2^2$
 $a^2 = \frac{4 \times 0.6^2 - 0.2^2}{3}$
 $a = 0.6831...$

The distance AB is 1.37 m (3 s.f.)

AB is twice the amplitude.

b Using ①
$$9 = \omega^2 (0.6831^2 - 0.6^2)$$

$$\omega^2 = \frac{9}{(0.6831^2 - 0.6^2)}$$

$$\omega = 9.187$$

period =
$$\frac{2\pi}{\omega} = \frac{2\pi}{9.187} = 0.6838...$$

The period is 0.684s (3 s.f.).

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise C, Question 9

Ouestion:

A particle is moving in a straight line with simple harmonic motion. When the particle is 1 m from the centre of the oscillation, O, its speed is $0.1 \,\mathrm{m\,s^{-1}}$. The period of the motion is 2π seconds. Calculate

- a the maximum speed of the particle,
- b the speed of the particle when it is 0.4 m from O.

Solution:

a period =
$$\frac{2\pi}{\omega} = 2\pi$$

$$\omega = 1$$

$$v^2 = \omega^2(a^2 - x^2)$$

$$x = 1 \text{ m}, v = 0.1 \text{ m s}^{-1}$$

$$0.1^2 = 1^2(a^2 - 1^2)$$

$$a^2 = 0.1^2 + 1^2$$

$$a = 1.004...$$

$$v_{\text{max}} = \omega a$$

$$= 1 \times 1.004...$$
The maximum speed is 1.00 m s^{-1} (3 s.f.).

b $v^2 = 1(1.004^2 - 0.4^2)$ v = 0.9219...The speed is 0.922 m s^{-1} (3 s.f.).

Further dynamics Exercise C, Question 10

Question:

A piston of mass 1.2 kg is moving with simple harmonic motion inside a cylinder. The distance between the end points of the motion is 2.5 m and the piston is performing 30 complete oscillations per minute. Calculate the maximum value of the kinetic energy of the piston.

Solution:

$$a = \frac{2.5}{2} = 1.25$$

$$Period = \frac{2\pi}{\omega} = \frac{60}{30} = 2$$

$$\omega = \pi$$

$$v_{\text{max}} = a\omega$$

$$= 1.25 \times \pi$$

$$m \text{ aximum K.E.} = \frac{1}{2} m v_{\text{max}}^2$$

$$= \frac{1}{2} \times 1.2 \times 1.25^2 \times \pi^2$$

$$= 9.252 \dots$$
The maximum K.E. is 9.25 J (3 s.f.).

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise C, Question 11

Ouestion:

A marker buoy is moving in a vertical line with simple harmonic motion. The buoy rises and falls through a distance of 0.8 m and takes 2 s for each complete oscillation. Calculate

- a the maximum speed of the buoy,
- b the time taken for the buoy to fall a distance 0.6 m from its highest point.

Solution:

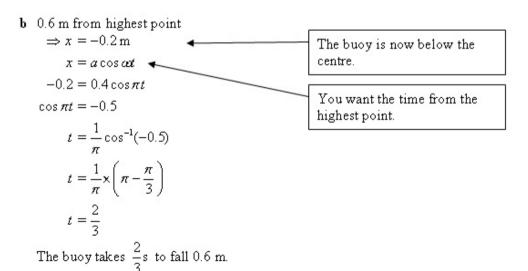

a
$$a = 0.8 \div 2 = 0.4 \,\mathrm{m}$$

period = $\frac{2\pi}{\omega} = 2$

The amplitude is half the distance between the highest and lowest points.

 $x = 0 \quad v = \omega a$
 $v = \pi \times 0.4$
 $v = 1.256...$

The maximum speed is 1.26 m s⁻¹ (3 s.f.).

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise C, Question 12

Question:

Points O, A and B lie in that order in a straight line. A particle P is moving on the line with simple harmonic motion. The motion has period 2 s and amplitude 0.5 m. The point O is the centre of the oscillation, $OA = 0.2 \,\mathrm{m}$ and $OB = 0.3 \,\mathrm{m}$. Calculate the time taken by P to move directly from A to B.

Solution:

period =
$$\frac{2\pi}{\omega} = 2$$

 $\therefore \omega = \pi$
 $x = a \sin \omega t$
 $x = 0.5 \sin \pi t$

$$x = 0.2 \text{ m } 0.2 = 0.5 \sin \pi t_1$$

$$\pi t_1 = \sin^{-1} \left(\frac{0.2}{0.5}\right) = \sin^{-1} \left(\frac{2}{5}\right)$$

$$x = 0.3 \quad \pi t_2 = \sin^{-1} \left(\frac{3}{5}\right)$$

$$time A \rightarrow B = t_2 - t_1$$

$$= \frac{1}{\pi} \left(\sin^{-1} \left(\frac{3}{5}\right) - \sin^{-1} \left(\frac{2}{5}\right)\right)$$

$$= 0.07384...$$
Use $x = a \sin \omega t$ to find the time to go from O to B .

The time to move directly from A to B is 0.0738 (3 s.f.).

Further dynamics Exercise C, Question 13

Question:

A particle P is moving along the x-axis. At time t seconds the displacement, x metres, of P from the origin O is given by $x = 4 \sin 2t$.

- a Prove that P is moving with simple harmonic motion.
- b Write down the amplitude and period of the motion.
- c Calculate the maximum speed of P.
- d Calculate the least value of t(t > 0) for which P's speed is 4 m s⁻¹.
- e Calculate the least value of t(t > 0) for which x = 2.

Solution:

a
$$x = 4 \sin 2t$$

 $\dot{x} = 8 \cos 2t$
 $\ddot{x} = -16 \sin 2t$
 $\ddot{x} = -4(4 \sin 2t)$

$$\ddot{x} = -4x$$

b amplitude = 4 m
period =
$$\frac{2\pi}{2} = \pi s$$

Compare $x = 4 \sin 2t$ with $x = a \sin \omega t$ to obtain a and ω .

c
$$v^2 = \omega^2 (a^2 - x^2)$$

$$x = 0 \quad v^2 = 4(4^2 - 0)$$

$$v = 8$$

The maximum speed is $8 \, \mathrm{m \ s^{-1}}$.

d
$$x = 4 \sin 2t$$

 $\dot{x} = 8 \cos 2t$
 $\dot{x} = 4 \text{ m s}^{-1}$ $4 = 8 \cos 2t$
 $\cos 2t = 0.5$
 $t = \frac{1}{2} \cos^{-1} 0.5$
 $t = \frac{1}{2} \times \frac{\pi}{3}$

From a.

The least value of t is $\frac{\pi}{6}$.

e
$$x = 4 \sin 2t$$
$$x = 2 \quad 2 = 4 \sin 2t$$
$$\sin 2t = 0.5$$
$$t = \frac{1}{2} \sin^{-1} 0.5$$
$$t = \frac{1}{2} \times \frac{\pi}{6}$$

The least value of t is $\frac{\pi}{12}$.

Further dynamics Exercise C, Question 14

Question:

A particle P is moving along the x-axis. At time t seconds the displacement, x metres,

of P from the origin O is given by
$$x = 3\sin\left(4t + \frac{1}{2}\right)$$
.

- a Prove that P is moving with simple harmonic motion.
- b Write down the amplitude and period of the motion.
- c Calculate the value of x when t = 0.
- d Calculate the value of $t(t \ge 0)$ the first time P passes through O.

$$\mathbf{a} \quad x = 3\sin\left(4t + \frac{1}{2}\right)$$
$$\dot{x} = 12\cos\left(4t + \frac{1}{2}\right)$$
$$\ddot{x} = -48\sin\left(4t + \frac{1}{2}\right)$$
$$\ddot{x} = -16x$$

.. S.H.M.

b amplitude = 3 m
period =
$$\frac{2\pi}{\omega} = \frac{2\pi}{4} = \frac{\pi}{2}$$
 s

Compare with $x = a \sin(\omega t + \varepsilon)$ to obtain a and ω .

$$c t = 0 x = 3\sin\left(\frac{1}{2}\right)$$
$$= 1.438...$$

When t = 0, x = 1.44 (3 s.f.)

$$\mathbf{d} \quad x = 0 \quad 0 = 3\sin\left(4t + \frac{1}{2}\right)$$

$$\sin\left(4t + \frac{1}{2}\right) = 0$$

$$4t + \frac{1}{2} = 0, \pi, \dots$$

$$4t = \left(0 - \frac{1}{2}\right), \left(\pi - \frac{1}{2}\right), \dots$$

$$t = -\frac{1}{8}(\text{not applicable})$$

$$t = \frac{1}{4}\left(\pi - \frac{1}{2}\right) = 0.6603\dots$$

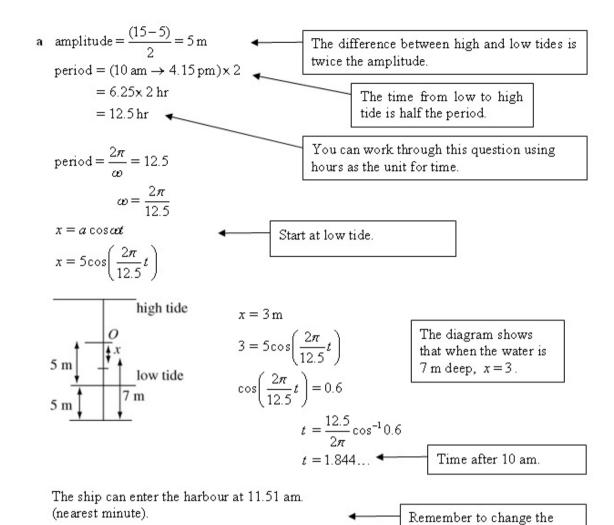

The value of t is 0.660 (3 s.f.).

Further dynamics Exercise C, Question 15

Question:

On a certain day, low tide in a harbour is at 10 a.m. and the depth of the water is 5 m. High tide on the same day is at 4.15 p.m. and the water is then 15 m deep. A ship which needs a depth of water of 7 m needs to enter the harbour. Assuming that the water can be modelled as rising and falling with simple harmonic motion, calculate

- a the earliest time, to the nearest minute, after 10 a.m. at which the ship can enter the harbour,
- b the time by which the ship must leave.

decimal part of 1.844 into minutes (0.844 x 60).

Use the symmetry of

required.

S.H.M. to find the time

© Pearson Education Ltd 2009

after 10 am

= 10.656 hrs after 10 am

= 10 hr 39.3...min.

b The water is once more 7 m deep at (12.5-1.844) hours

.. Ship must leave by 8.39 pm (nearest minute).

Further dynamics Exercise C, Question 16

Ouestion:

Points A, O and B lie in that order in a straight line. A particle P is moving on the line with simple harmonic motion with centre O. The period of the motion is 4 s and the amplitude is 0.75 m. The distance OA is 0.4 m and AB is 0.9 m. Calculate the time taken by P to move directly from B to A.

Solution:

Solutionbank M3

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise D, Question 1

Ouestion:

A particle P of mass 0.5 kg is attached to one end of a light elastic spring of natural length 0.6 m and modulus of elasticity 60 N. The other end of the spring is fixed to a point A on the smooth horizontal surface on which P rests. The particle is held at rest with AP = 0.9 m and then released.

- a Show that P moves with simple harmonic motion.
- b Find the period and amplitude of the motion.
- c Calculate the maximum speed of P.

Solution:

A
$$T \stackrel{P}{\longrightarrow} 0.5 \text{ kg}$$
 $\lambda = 60 \text{ N}$

a
$$F = m\alpha$$

 $-T = 0.5\ddot{x}$

Hooke's law:
$$T = \frac{\lambda x}{l}$$

$$T = \frac{60x}{0.6} = 100x$$

$$-100x = 0.5\ddot{x}$$

$$\ddot{x} = -\frac{100}{0.5}x$$

$$\ddot{x} = -200x$$

The equation of motion must reduce to the form $\ddot{x} = -\omega^2 x$.

.: S.H.M.

b
$$\omega^2 = 200$$
 $\omega = \sqrt{200} = 10\sqrt{2}$

$$period = \frac{2\pi}{\omega} = \frac{2\pi}{10\sqrt{2}} = \frac{\pi}{10}\sqrt{2}$$

$$\therefore$$
 period is $\frac{\pi}{10}\sqrt{2}$ s (or 0.444s (3 s.f.))

amplitude =
$$0.9 - 0.6 = 0.3$$

The amplitude is the same as the initial extension.

$$c \quad v^2 = \omega^2 (a^2 - x^2)$$

$$v_{\text{max}} = \omega \alpha = 10\sqrt{2} \times 0.3$$
$$= 3\sqrt{2}$$

Use x = 0 for the maximum speed.

The maximum speed is $3\sqrt{2}$ m s⁻¹ or 4.24 m s⁻¹ (3 s.f.)

Further dynamics Exercise D, Question 2

Question:

A particle P of mass 0.8 kg is attached to one end of a light elastic string of natural length 1.6 m and modulus of elasticity 20 N. The other end of the string is fixed to a point O on the smooth horizontal surface on which P rests. The particle is held at rest with OP = 2.6 m and then released.

- a Show that, while the string is taut, P moves with simple harmonic motion.
- **b** Calculate the time from the instant of release until P returns to its starting point for the first time.

$$O \longrightarrow T \qquad P \qquad 0.8 \text{ kg}$$

$$\chi \qquad \longrightarrow \ddot{\chi} \qquad \lambda = 20 \text{ N}$$

a
$$F = ma$$

 $-T = 0.8\ddot{x}$
Hooke's Law: $T = \frac{\lambda x}{l}$
 $T = \frac{20}{1.6}x$
 $-\frac{20}{1.6}x = 0.8\ddot{x}$
 $\ddot{x} = -\frac{20x}{1.6 \times 0.8} = -\frac{10x}{0.8^2}$
 \therefore S.H.M.

b $\omega = \frac{\sqrt{10}}{0.8}$
 \therefore period $= \frac{2\pi}{\omega} = 2\pi \times \frac{0.8}{\sqrt{10}} = \frac{1.6\pi}{\sqrt{10}}$
amplitude $= 2.6 - 1.6 = 1 \text{ m}$
 $v^2 = \omega^2 (a^2 - x^2)$
 $v_{\text{max}} = \omega x = 1 \times \frac{\sqrt{10}}{0.8}$
total distance at this speed $= 4 \times 1.6$
 $= 6.4 \text{ m}$
time $= 6.4 \times \frac{0.8}{\sqrt{10}}$
 \therefore total time $= 6.4 \times \frac{0.8}{\sqrt{10}} + \frac{1.6\pi}{\sqrt{10}} = 3.208...$
For the middle section the particle moves at a constant speed (= the maximum speed of the S.H.M.)

Further dynamics Exercise D, Question 3

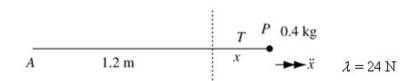

Ouestion:

A particle P of mass 0.4 kg is attached to one end of a light elastic string of modulus of elasticity 24 N and natural length 1.2 m. The other end of the string is fixed to a point A on the smooth horizontal table on which P rests. Initially P is at rest with AP = 1 m. The particle receives an impulse of magnitude 1.8 N s in the direction AP.

- a Show that, while the string is taut, P moves with simple harmonic motion.
- **b** Calculate the time that elapses between the moment P receives the impulse and the next time the string becomes slack.

The particle comes to instantaneous rest for the first time at the point B.

c Calculate the distance AB.

$$\mathbf{a} \quad F = ma$$

$$-T = 0.4\ddot{x}$$

Hooke's Law: $T = \frac{\lambda x}{I}$

$$T = \frac{\lambda x}{l}$$

$$T = \frac{24x}{1.2} = 20x$$

$$\therefore -20x = 0.4\ddot{x}$$

$$\ddot{x} = -\frac{20}{0.4}x$$

$$\ddot{x} = -50x$$

b For the impact I = mv - mu

$$1.8 = 0.4v$$

$$v = \frac{1.8}{0.4} = 4.5$$

$$period = \frac{2\pi}{\omega} = \frac{2\pi}{5\sqrt{2}}$$

This is the speed of P while the string is slack. It is also the maximum speed for the S.H.M.

The required time includes half a period.

 \therefore time for half an oscillation = $\frac{\pi}{5\sqrt{2}}$ s

time at constant speed

$$=\frac{0.2}{4.5}=\frac{2}{45}s$$

P travels 0.2 m before the string becomes taut.

total time = $\frac{\pi}{5\sqrt{2}} + \frac{2}{45} = 0.4887...$

time is 0.489 s (3 s.f.)

$$v^2 = \omega^2 (\alpha^2 - x^2)$$

 $v_{\rm max} = 4.5 \; {\rm m \; s^{-1}}$

ω and the maximum speed are known so the amplitude can be found.

$$\therefore 4.5 = a\omega$$

$$a = \frac{4.5}{5\sqrt{2}}$$

$$AB = 1.2 + \frac{4.5}{5\sqrt{2}}$$

= 1.836

AB is the natural length of the string plus the amplitude of the S.H.M.

Distance AB is 1.84 m (3 s.f.)

Solutionbank M3

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise D, Question 4

Question:

A particle P of mass 0.8 kg is attached to one end of a light elastic spring of natural length 1.2 m and modulus of elasticity 80 N. The other end of the spring is fixed to a point O on the smooth horizontal surface on which P rests. The particle is held at rest with OP = 0.6 m and then released.

- a Show that P moves with simple harmonic motion.
- b Find the period and amplitude of the motion.
- c Calculate the maximum speed of P.

Solution:

$$O = \begin{array}{cccc} & & & & & & & & & \\ & T & & P & 0.8 \text{ kg} & & & & \\ & & & \chi & & & \ddot{\chi} & & \lambda = 80 \text{ N} \end{array}$$

a
$$F = m\alpha$$

 $-T = 0.8\ddot{x}$

Hooke's Law:
$$T = \frac{\lambda x}{l}$$

$$T = \frac{80x}{1.2}$$

$$0.8\ddot{x} = -\frac{80}{1.2}x$$

$$\ddot{x} = -\frac{100}{1.2}x$$

$$\therefore \text{ SHM}$$

b
$$\omega = \sqrt{\frac{100}{1.2}} = \frac{10}{\sqrt{1.2}}$$

period = $\frac{2\pi}{\omega} = \frac{2\pi}{10} \sqrt{1.2}$

= 0.6882...

period is 0.688 s (3 s.f.)

$$v^{2} = \omega^{2}(\alpha^{2} - x^{2})$$

$$v_{\text{max}} = \omega \alpha$$

$$= \frac{10}{\sqrt{1.2}} \times 0.6$$

$$= 5.477$$

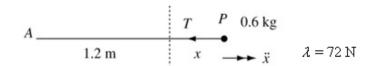

The max speed is $5.48 \,\mathrm{m \ s^{-1}}$ (3 s.f.)

Further dynamics Exercise D, Question 5

Question:

A particle P of mass 0.6 kg is attached to one end of a light elastic spring of modulus of elasticity 72 N and natural length 1.2 m. The other end of the spring is fixed to a point A on the smooth horizontal table on which P rests. Initially P is at rest with AP = 1.2 m. The particle receives an impulse of magnitude 3 N s in the direction AP. Given that t seconds after the impulse the displacement of P from its initial position is t metres

- a find an equation for x in terms of t,
- b calculate the maximum magnitude of the acceleration of P.

a
$$F=ma$$

 $-T=0.6\ddot{x}$ Use $F=ma$ and Hooke's Law to obtain the value of ω .
Hooke's Law: $T=\frac{\lambda x}{l}$ $T=\frac{72x}{1.2}=60x$

$$T = \frac{1}{1.2} = 60x$$

$$\therefore -60x = 0.6\ddot{x}$$

$$\ddot{x} = -\frac{60}{0.6}x$$

$$\ddot{x} = -100x$$

$$\therefore \omega^2 = 100, \omega = 10$$

For the impact:
$$I = mv - mu$$

 $3 = 0.6v - 0$
 $v = \frac{3}{0.6} = 5$

Use impulse = change of momentum to obtain the maximum speed.

∴ maximum speed is 5 m s⁻¹

$$v^2 = \omega^2 (a^2 - x^2)$$

 $v_{\max} = \alpha \alpha$

5 = 10a

$$a = \frac{5}{10} = 0.5$$

 $x = a \sin \omega t$

$$x = 0.5 \sin 10t$$

 $\therefore x = 0.5 \sin 10t$

P is at the centre of the oscillation when t = 0.

Now the amplitude can be obtained.

b
$$\ddot{x} = -100x$$

 $|\ddot{x}| = 100 |x|$
 $|\ddot{x}|_{\text{max}} = 100 \times 0.5 = 50$

The amplitude gives the maximum value of |x|.

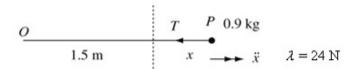

The maximum magnitude of the acceleration is 50 m s⁻².

Further dynamics Exercise D, Question 6

Ouestion:

A particle of mass 0.9 kg rests on a smooth horizontal surface attached to one end of a light elastic string of natural length 1.5 m and modulus of elasticity 24 N. The other end of the string is attached to a point on the surface. The particle is pulled so that the string measures 2 m and released from rest.

- a State the amplitude of the resulting oscillation.
- **b** Calculate the speed of the particle when the string becomes slack. Before the string becomes taut again the particle hits a vertical surface which is at right angles to the particle's direction of motion. The coefficient of restitution between the particle and the vertical surface is $\frac{3}{5}$.
- c Calculate i the period and ii the amplitude of the oscillation which takes place when the string becomes taut once more.

a amplitude =
$$(2-1.5)$$
 m = 0.5 m

b energy: K.E. gained =
$$\frac{1}{2}mv^2 = \frac{1}{2} \times 0.9v^2$$

E.P.E. lost = $\frac{\lambda x^2}{2l} = \frac{24 \times 0.5^2}{2 \times 1.5}$

$$\frac{1}{2} \times 0.9v^2 = 24 \times \frac{0.5^2}{2 \times 1.5}$$

$$v^2 = \frac{2 \times 24 \times 0.5^2}{0.9 \times 2 \times 1.5}$$

b can be solved by using conservation of energy or by S.H.M. methods, finding the maximum speed for the oscillation.

The speed is $2.11 \,\mathrm{m \ s^{-1}}$ (3 s.f.).

c Impact with the wall:

Newton's law of impact: eu = v

$$v = \frac{3}{5} \times 2.108...$$
= 1.264...

... maximum speed for the new oscillation is 1.264 m s⁻¹

$$F = ma$$
$$-T = 0.9\ddot{x}$$

Hooke's Law: $T = \frac{\lambda x}{I}$

$$T = \frac{24}{1.5}x = 16x$$

 $\therefore -16x = 0.9x$

$$\ddot{x} = -\frac{16}{0.9}x$$

$$\therefore \omega = \frac{4}{\sqrt{0.9}}$$

period =
$$\frac{2\pi}{\omega} = 2\pi \frac{\sqrt{0.9}}{4} = 1.490...$$

The period is 1.49s (3 s.f.).

$$v^2 = \omega^2 (a^2 - x^2)$$

$$v_{\mathrm{max}} = \omega a$$

$$1.264 = \frac{4}{\sqrt{0.9}}a$$

$$a = 1.264 \times \frac{\sqrt{0.9}}{4}$$

$$a = 0.2997$$

The amplitude is 0.300 m (3 s.f.)

S.H.M. methods essential for this part.

Now ω is known you can find the amplitude using $v^2 = \omega^2 (a^2 - x^2)$ with the maximum speed.

Solutionbank M3

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise D, Question 7

Question:

A smooth cylinder is fixed with its axis horizontal. A piston of mass 2.5 kg is inside the cylinder, attached to one end of the cylinder by a spring of modulus of elasticity 400 N and natural length 50 cm. The piston is held at rest in the cylinder with the spring compressed to a length of 42 cm. The piston is then released. The spring can be modelled as a light elastic spring and the piston can be modelled as a particle.

- a Find the period of the resulting oscillations.
- b Find the maximum value of the kinetic energy of the piston.

Solution:

$$\begin{array}{c|cccc}
 & T & P & 2.5 \text{ kg} \\
\hline
 & 0.5 \text{ m} & x & & \ddot{x} & \lambda = 400 \text{ N}
\end{array}$$

a
$$F = m\alpha$$

 $-T = 2.5\ddot{x}$
Hooke's Law: $T = \frac{\lambda x}{l}$
 $T = \frac{400x}{0.5} = 800x$
 $-800x = 2.5\ddot{x}$
 $\ddot{x} = -\frac{800}{2.5}x$
 $\ddot{x} = -320x$
 $\omega = \sqrt{320}$
period $= \frac{2\pi}{\omega} = \frac{2\pi}{\sqrt{320}} = 0.3512...$

The period is 0.351 s (3 s.f.)

b amplitude =
$$(50-42)$$
cm
= 0.08 m
 $v^2 = \omega^2 (a^2 - x^2)$
 $v_{\text{max}} = \omega a$
= $\sqrt{320 \times 0.08}$
maximum K.E = $\frac{1}{2} \times 2.5 \times (\sqrt{320 \times 0.08})^2$
= 2.56

The maximum K.E. is 2.56 J.

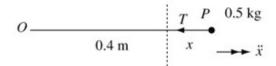

Further dynamics Exercise D, Question 8

Ouestion:

A particle P of mass 0.5 kg is attached to one end of a light elastic string of natural length 0.4 m and modulus of elasticity 30 N. The other end of the string is attached to a point on the smooth horizontal surface on which P rests. The particle is pulled until the string measures 0.6 m and then released from rest.

a Calculate the speed of P when the string becomes slack for the first time. When P has travelled a distance 0.3 m from the point of release the surface becomes rough. The coefficient of friction between P and the surface is 0.25. The particle comes to rest T seconds after it was released.

b Find the value of T.

a
$$F = ma$$

 $-T = 0.5\ddot{x}$

Hooke's Law:
$$T = \frac{\lambda x}{l}$$

$$T = \frac{30}{0.4}x = 75x$$

$$\therefore 0.5\ddot{x} = -75x$$

$$\ddot{x} = -\frac{75}{0.5}x$$

$$\ddot{x} = -150x$$

$$\therefore \omega = \sqrt{150}$$
amplitude = $0.6 - 0.4 = 0.2$ m
$$v^2 = \omega^2(a^2 - x^2)$$

$$v_{\text{max}} = a\omega$$

$$= \sqrt{150} \times 0.2$$

a can be done by conservation of energy but the period of the oscillation is needed for **b**.

When the string becomes slack P's speed is 2.45 m s⁻¹ (3 s.f.).

= 2.449...

$$\mathbf{b} \quad \text{period} = \frac{2\pi}{\omega} = \frac{2\pi}{\sqrt{150}}$$

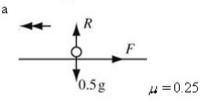

The first part of the motion is $\frac{1}{4}$ of an oscillation.

On the smooth floor:

$$time = \frac{0.1}{2.449}$$

For the first 0.2 m the string is taut.

On the rough floor:

$$-F = 0.5a$$

$$F = \mu R = 0.25 \times 0.5g$$
∴ $0.5a = -0.25 \times 0.5g$

$$a = -0.25g$$

$$v = u + at$$

$$0 = 2.449 - 0.25gt$$

$$t = \frac{2.449}{0.25 \times 9.8}$$

$$total time = \frac{1}{4} \times \frac{2\pi}{\sqrt{150}} + \frac{0.1}{2.449} + \frac{2.449}{0.25 \times 9.8}$$

$$= 1.168...$$
∴ $T = 1.17 (3 \text{ s.f.})$
Find the acceleration.

Find the acceleration.

Find the acceleration.

Solutionbank M3

Edexcel AS and A Level Modular Mathematics

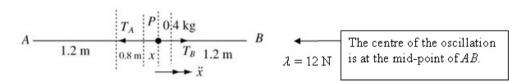

Further dynamics Exercise D, Question 9

Question:

A particle P of mass 0.4 kg is attached to two identical light elastic springs each of natural length 1.2 m and modulus of elasticity 12 N. The free ends of the strings are attached to points A and B which are 4 m apart on a smooth horizontal surface. The point C lies between A and B with AC = 1.4 m and CB = 2.6 m. The particle is held at C and released from rest.

- a Show that P moves with simple harmonic motion.
- b Calculate the maximum value of the kinetic energy of P.

Solution:

The tensions in the two

parts of the string are

different.

$$\mathbf{a} \quad F = m\alpha$$

$$T_B - T_A = 0.4\ddot{x}$$

Hooke's Law:
$$T = \frac{\lambda x}{l}$$

$$AP$$
: extension = $(0.8 + x)$

$$T_A = \frac{12(0.8+x)}{1.2} = 10(0.8+x)$$

$$BP$$
: extension = $(0.8 - x)$

$$T_{B} = \frac{12(0.8 - x)}{1.2} = 10(0.8 - x)$$

$$10(0.8-x)-10(0.8+x)=0.4x$$

$$-20x = 0.4\ddot{x}$$

$$\ddot{x} = -\frac{20}{0.4} x = -50x$$

... P moves with S.H.M.

$$\mathbf{b} \quad \boldsymbol{\omega}^2 = 50$$

amplitude =
$$0.6 m$$

$$v^{2} = \omega^{2}(a^{2} - x^{2})$$

$$v_{\text{max}}^{2} = \omega^{2}a^{2}$$

$$= 50 \times 0.6^{2}$$

m aximum K.E. =
$$\frac{1}{2} m v_{\text{max}}^2$$

= $\frac{1}{2} \times 0.4 \times 50 \times 0.6^2$
= 3.6

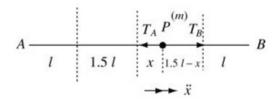

The maximum K.E. is 3.6 J.

Further dynamics Exercise D, Question 10

Ouestion:

A particle P of mass m is attached to two identical light strings of natural length l and modulus of elasticity 3mg. The free ends of the strings are attached to fixed points A and B which are 5l apart on a smooth horizontal surface. The particle is held at the point C, where AC = l and A, B and C lie on a straight line, and is then released from rest.

- a Show that P moves with simple harmonic motion.
- b Find the period of the motion.
- c Write down the amplitude of the motion.
- d Find the speed of P when AP = 3l.

The centre of the oscillation is at the mid-point of
$$AB$$
.

a
$$F = ma$$

$$T_B - T_A = m\ddot{x}$$

Hooke's Law:
$$T = \frac{\lambda x}{l}$$

extension =
$$1.5l + x$$

$$AP: T_A = \frac{3mg(1.5l+x)}{l}$$

$$PB$$
: extension = $1.5l - 2$

$$T_{B} = \frac{3mg(1.5l - x)}{l}$$

$$\therefore \frac{3mg(1.5l - x)}{l} - \frac{3mg(1.5l + x)}{l} = m\ddot{x}$$
$$-\frac{6mgx}{l} = m\ddot{x}$$

$$\ddot{x} = -\frac{6g}{l}x$$

∴ S.H.M.

$$\mathbf{b} \quad \omega^2 = \frac{6g}{l} \quad \omega^2 = \sqrt{\frac{6g}{l}}$$
$$\text{period} = \frac{2\pi}{\omega} = 2\pi \sqrt{\frac{l}{6g}}$$

c Amplitude =
$$1.5l$$

$$\mathbf{d} \qquad \qquad v^2 = \omega^2 (a^2 - x^2)$$

$$AP = 3l \Rightarrow x = \frac{l}{2}$$

$$\therefore v^2 = \frac{6g}{l} \left(\left(\frac{3l}{2} \right)^2 - \left(\frac{l}{2} \right)^2 \right)$$

$$v^2 = \frac{6g}{l} \left(\frac{9l^2}{4} - \frac{l^2}{4} \right)$$

$$v^2 = \frac{6g}{l} \times \frac{8l^2}{4}$$

$$v^2 = 12gl$$

When AP = 3l, P's speed is $\sqrt{12gl}$ (or $2\sqrt{3gl}$).

Further dynamics Exercise D, Question 11

Question:

A light elastic string has natural length 2.5 m and modulus of elasticity 15 N. A particle P of mass 0.5 kg is attached to the string at the point K where K divides the unstretched string in the ratio 2:3. The ends of the string are then attached to the points A and B which are 5 m apart on a smooth horizontal surface. The particle is then pulled aside and held at rest in contact with the surface at the point C where AC = 3 m and ACB is a straight line. The particle is then released from rest.

- a Show that P moves with simple harmonic motion of period $\frac{\pi}{5}\sqrt{2}$.
- b Find the amplitude of the motion.

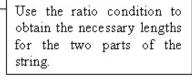

a When P is in equilibrium:

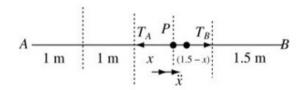

$$AP = \frac{2}{5} \times 5 = 2 \text{ m}$$

$$BP = 3 \,\mathrm{m}$$

Natural lengths: $AP = 1 \,\mathrm{m}$

$$BP = 1.5 \, \text{m}$$

$$F = ma$$

$$T_B - T_A = 0.5\ddot{x}$$

Hooke's Law: $T = \frac{\lambda x}{l}$

AP: extension = 1+x

$$T_A = \frac{15(1+x)}{1}$$

BP: extension = 1.5 - x

$$T_B = \frac{15(1.5 - x)}{1.5} = 10(1.5 - x)$$

$$\therefore 10(1.5 - x) - 15(1 + x) = 0.5\ddot{x}$$

$$-25x = 0.5\ddot{x}$$

$$\ddot{x} = -50x$$

∴ S.H.M.

period =
$$\frac{2\pi}{\omega} = \frac{2\pi}{\sqrt{50}} = \frac{2\pi}{5\sqrt{2}} = \frac{\pi}{5}\sqrt{2}$$

b Amplitude = (3-2)m = 1 m.

Further dynamics Exercise E, Question 1

Ouestion:

A particle P of mass 0.75 kg is hanging in equilibrium attached to one end of a light elastic spring of natural length 1.5 m and modulus of elasticity 80 N. The other end of the spring is attached to a fixed point A vertically above P.

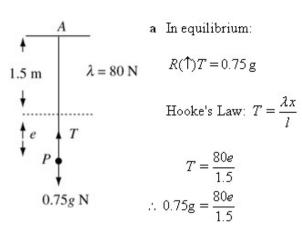

a Calculate the length of the spring.

The particle is pulled downwards and held at a point B which is vertically below A. The particle is then released from rest.

- b Show that P moves with simple harmonic motion.
- c Calculate the period of the oscillations.

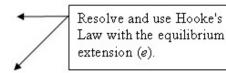

The particle passes through its equilibrium position with speed 2.5 m s⁻¹.

d Calculate the amplitude of the oscillations.

a In equilibrium:

$$R(\uparrow)T = 0.75 \,\mathrm{g}$$

$$T = \frac{80e}{1.5}$$

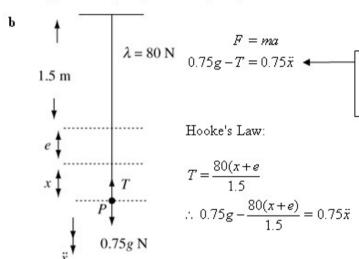

$$\therefore 0.75g = \frac{80e}{1.5}$$

$$e = 0.75 \times 9.8 \times \frac{1.5}{80}$$

The total length of the spring is required.

of the form $\ddot{x} = -\omega^2 x$

The length of the spring is 1.64 m (3 s.f.)

$$0.75g - T = 0.75\ddot{x}$$

x is measured from the equilibrium level, and \ddot{x} is in the direction of increasing x.

$$T = \frac{80(x + 6)}{1.5}$$

$$\therefore 0.75g - \frac{80(x+e)}{1.5} = 0.75\ddot{x}$$

To avoid decimals use (e+x) for the extension

from a
$$0.75 \text{ g} = \frac{80 \text{ e}}{1.5}$$

$$\therefore 0.75 \, \ddot{x} = -\frac{80}{1.5} x$$

$$\ddot{x} = -\frac{80}{1.5 \times 0.75} x$$

. S.H.M.

c
$$\omega^2 = \frac{80}{1.5 \times 0.75}$$

Period = $\frac{2\pi}{\omega} = 2\pi \sqrt{\frac{1.5 \times 0.75}{80}}$
= 0.7450...

The period is 0.745s (3 s.f.)

d
$$v^2 = \omega^2 (a^2 - x^2)$$

 $2.5^2 = \frac{80}{1.5 \times 0.75} a^2$
 $a^2 = \frac{2.5^2 \times 1.5 \times 0.75}{80}$
 $a = 0.2964...$

The amplitude is 0.296 m (3 s.f.)

Further dynamics Exercise E, Question 2

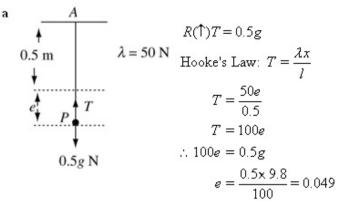

Question:

A particle P of mass 0.5 kg is attached to the free end of a light elastic spring of natural length 0.5 m and modulus of elasticity 50 N. The other end of the spring is attached to a fixed point A and P hangs in equilibrium vertically below A.

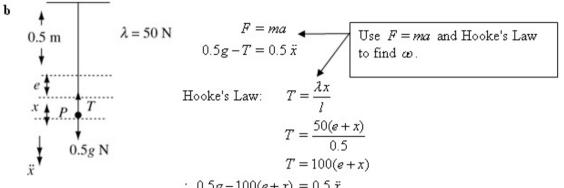

a Calculate the extension of the spring.

The particle is now pulled vertically down a further 0.2 m and released from rest.

- b Calculate the period of the resulting oscillations.
- c Calculate the maximum speed of the particle.

The extension is 0.049 m (or 4.9 cm)

$$\therefore 0.5g - 100(e + x) = 0.5 \,\bar{x}$$

from a
$$100e = 0.5g$$

$$\therefore -100x = 0.5 \ddot{x}$$

$$\ddot{x} = -200x$$

$$\omega^2 = 200$$
Compare previous line with $\ddot{x} = -\omega^2 x$.
$$\text{period} = \frac{2\pi}{\omega} = \frac{2\pi}{\sqrt{200}} = \frac{2\pi}{10\sqrt{2}} = \frac{\pi}{10}\sqrt{2}$$

The period is $\frac{\pi}{10}$ $\sqrt{2}$ s (or 0.444s (3 s.f.)).

c amplitude = 0.2 m

$$v^2 = \omega^2(a^2 - x^2)$$

 $v_{\text{max}} = \omega a$ The maximum speed occurs at the equilibrium level (i.e. when $x = 0$).
 $= 2\sqrt{2}$

The maximum speed is $2\sqrt{2}$ m s⁻¹ (or 2.83 m s⁻¹ (3 s.f.)).

Further dynamics Exercise E, Question 3

Question:

A particle P of mass 2 kg is hanging in equilibrium attached to the free end of a light elastic spring of natural length 1.5 m and modulus of elasticity λN . The other end of the spring is fixed to a point A vertically above P. The particle receives an impulse of magnitude 3 Ns in the direction AP.

- a Find the speed of P immediately after the impact.
- b Show that P moves with simple harmonic motion.

The period of the oscillations is $\frac{\pi}{2}$ s.

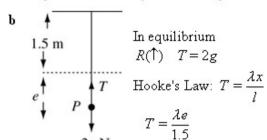

- c Find the value of 1.
- d Find the amplitude of the oscillations.

a For the impact: I = mv - mu

$$3 = 2v$$

$$v = 1.5$$

The speed immediately after the impact is 1.5 m s⁻¹.

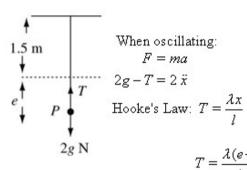

$$R(\uparrow)$$
 $T=2g$

$$T = \frac{\lambda e}{1.5}$$

$$\frac{\lambda e}{1.5} = 2g$$

 λ is unknown so will remain in this

When oscillating:

$$F = ma$$

$$2g - T = 2\ddot{x}$$

$$T = \frac{\lambda(e+x)}{1.5}$$

$$\therefore 2g - \frac{\lambda(e+x)}{1.5} = 2\ddot{x}$$

From above: $\frac{\lambda e}{1.5} = 2g$

$$\therefore -\frac{\lambda x}{1.5} = 2 \ddot{x}$$

$$\ddot{x} = -\frac{\lambda}{2}x$$

as $\lambda > 0$, this is S.H.M.

$$\epsilon \quad \text{period} = \frac{2\pi}{\omega} = \frac{\pi}{2}$$

$$\omega = 4$$

From
$$\ddot{x} = -\frac{\lambda}{3}x$$
, $\omega^2 = \frac{\lambda}{3}$

$$\therefore \frac{\lambda}{3} = 16$$

d maximum speed = $1.5 \,\mathrm{m \ s^{-1}}$

$$v^2 = \omega^2 (a^2 - x^2)$$

$$v_{\text{max}} = \alpha \alpha$$

$$1.5 = 4a$$

$$a = \frac{1.5}{4} = 0.375$$

Maximum speed occurs when x = 0.

The Particles And Maths Tutor.com

Further dynamics Exercise E, Question 4

Question:

A light elastic spring has one end A fixed and hangs vertically with a particle P of mass 0.6 kg attached to its free end. Initially P is hanging freely in equilibrium. The particle is then pulled vertically downwards and released from rest.

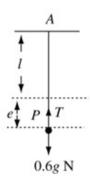

a Show that P moves with simple harmonic motion.

The period of the motion is $\frac{\pi}{5}$ s and the maximum and minimum distances of P below

A are 1.2 m and 0.8 m respectively. Calculate

- b the amplitude of the oscillation,
- c the maximum speed of P,
- d the maximum magnitude of the acceleration of P.

a

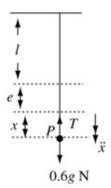

In equilibrium:

$$R(\uparrow)T = 0.6g$$

Hooke's Law: $T = \frac{\lambda x}{r}$

$$T = \frac{\lambda e}{l}$$

$$\therefore \frac{\lambda e}{l} = 0.6g$$

For the oscillation:

$$F = ma$$

$$0.6g - T = 0.6 \ddot{x}$$

Hooke's Law: $T = \frac{\lambda x}{l}$ $T = \frac{\lambda (e + x)}{l}$

$$\therefore 0.6g - \frac{\lambda(e+x)}{l} = 0.6 \, \ddot{x}$$

from above

$$\frac{\lambda e}{l} = 0.6g$$

$$\therefore 0.6 \, \ddot{x} = -\frac{\lambda x}{l}$$

$$\ddot{x} = -\frac{\lambda x}{0.6 \, l}$$

The equation of motion must reduce to the form $\ddot{x} = -\omega^2 x$ but ω^2 can be expressed algebraically.

As l and λ are both positive this is S.H.M.

b amplitude = $\frac{1}{2}(1.2 - 0.8)$ = 0.2

The amplitude is 0.2 m.

The difference between the maximum and minimum distances below A is twice the amplitude c.

c period =
$$\frac{2\pi}{\omega} = \frac{\pi}{5}$$

 $\therefore \omega = 10$
 $v^2 = \omega^2(a^2 - x^2)$
 $v_{\text{max}} = \omega a$
 $= 10 \times 0.2 = 2$

The maximum speed is 2 m s⁻¹.

 $\mathbf{d} \quad \ddot{x} = -\omega^2 x$ $\ddot{x} = -100 x$

Take maximum value of x.

 \therefore maximum magnitude of the acceleration = $100 \times 0.2 \text{ m s}^{-2}$ = 20 m s^{-2}

Further dynamics Exercise E, Question 5

Ouestion:

A piston of mass 2 kg moves inside a smooth cylinder which is fixed with its axis vertical. The piston is attached to the base of the cylinder by a spring of natural length 12 cm and modulus of elasticity 500 N. The piston is released from rest at a point where the spring is compressed to a length of 8 cm. Assuming that the spring can be modelled as a light elastic spring and the piston as a particle, calculate

- a the period of the resulting oscillations,
- b the maximum speed of the piston.

$$R(\uparrow)T = 2g$$

In equilibrium:

$$R(\uparrow)T = 2g$$

Hooke's Law: $T = \frac{\lambda x}{l}$
 $T = \frac{500e}{l}$
 $\therefore 2g = \frac{500e}{0.12}$

Change cm to m.

For the oscillations:

 $\lambda = 500 \, \text{N}$

$$F = ma$$

$$2g - T = 2\ddot{x}$$

Hooke's Law
$$T = \frac{\lambda x}{l}$$

$$T = \frac{500(e+x)}{0.12}$$

$$\therefore 2g - \frac{500(e+x)}{0.12} = 2\ddot{x}$$

From above:
$$\frac{500e}{0.12} = 2g$$

 $\therefore -\frac{500x}{0.12} = 2 \ddot{x}$

$$\ddot{x} = -\frac{250}{0.12}x$$

$$\omega^2 = \frac{250}{0.12}$$

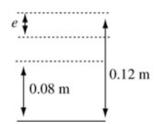

$$period = \frac{2\pi}{\omega} = 2\pi \sqrt{\frac{0.12}{250}}$$

$$= 0.1376...$$

Compare line above with $\ddot{x} = -\omega^2 x$.

The period is 0.138 s (3 s.f.)

b
$$e = \frac{2g \times 0.12}{500}$$

amplitude =
$$0.04 - e$$

$$v^{2} = \omega^{2}(a^{2} - x^{2})$$

$$v_{\text{max}} = a\omega$$

$$= \sqrt{\frac{250}{0.12}} \times (0.04 - e)$$

$$= \sqrt{\frac{250}{0.12}} \times \left(0.04 - \frac{2g \times 0.12}{500}\right)$$

$$= 1.611...$$

The maximum speed is 1.61 m s⁻¹ (3 s.f.).

Further dynamics Exercise E, Question 6

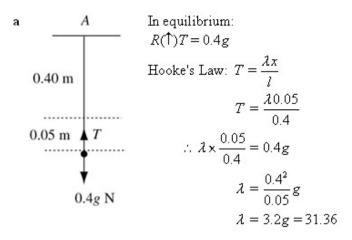

Ouestion:

A light elastic string of natural length 40 cm has one end A attached to a fixed point. A particle P of mass 0.4 kg is attached to the free end of the string and hangs freely in equilibrium vertically below A. The distance AP is 45 cm.

a Find the modulus of elasticity of the string.

The particle is now pulled vertically downwards until AP measures 52 cm and then released from rest.

- **b** Show that, while the string is taut, P moves with simple harmonic motion.
- c Find the period and amplitude of the motion.
- d Find the greatest speed of P during the motion.
- e Find the time taken by P to rise 11 cm from the point of release.

The modulus of elasticity is 31.4 N (3 s.f.)

For oscillations:

$$F = ma$$

 $0.4g - T = 0.4 \ddot{x}$
Hooke's Law: $T = \frac{\lambda x}{l}$
 $T = \frac{31.36(x + 0.05)}{0.4}$
 $0.4g - \frac{31.36(x + 0.05)}{0.4} = 0.4 \ddot{x}$
 $\ddot{x} = -\frac{31.36}{0.4^2} x$
 $\ddot{x} = -\frac{31.36}{0.4^2} x$
 $\ddot{x} = -\frac{31.36}{0.4^2} x$
 $\ddot{x} = -\frac{31.36}{0.4^2} x$

c From
$$\ddot{x} = -\frac{31.36}{0.4^2}x$$

$$\omega = \frac{\sqrt{31.36}}{0.4}$$

$$period = \frac{2\pi}{\omega} = 2\pi \times \frac{0.4}{\sqrt{31.36}} = 0.4487...$$

The period is 0.449 s. amplitude = 52-45=7 (cm)

The amplitude is 0.07 m.

$$\mathbf{d} \qquad \mathbf{v}^2 = \boldsymbol{\omega}^2 (a^2 - x^2)$$

$$\mathbf{v}_{\text{max}} = \boldsymbol{\omega} a$$

$$= \frac{\sqrt{31.36}}{0.4} \times 0.07$$

$$= 0.98$$

The maximum speed is $0.98\,\mathrm{m\ s^{-1}}$.

$$\Rightarrow AP = 41 \text{ cm}.$$

$$\therefore x = -4 \text{ cm} = -0.04 \text{ m}$$

$$x = a \cos \omega t$$

$$-0.04 = 0.07 \cos \omega t$$

$$\omega t = \cos^{-1} \left(-\frac{0.04}{0.07} \right) = \cos^{-1} \left(-\frac{4}{7} \right)$$

$$t = \frac{1}{\omega} \cos^{-1} \left(-\frac{4}{7} \right) = \frac{0.4}{\sqrt{31.36}} \cos^{-1} \left(-\frac{4}{7} \right)$$

$$= 0.1556...$$

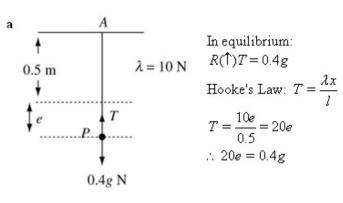

P takes 0.156s to rise 11 cm (3 s.f.).

Further dynamics Exercise E, Question 7

Ouestion:

A particle P of mass 0.4 kg is attached to one end of a light elastic string of natural length 0.5 m and modulus of elasticity 10 N. The other end of the string is attached to a fixed point A and P is initially hanging freely in equilibrium vertically below A. The particle is then pulled vertically downwards a further 0.2 m and released from rest.

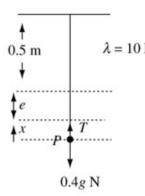

- a Calculate the time from release until the string becomes slack for the first time.
- b Calculate the time between the string first becoming slack and the next time it becomes taut

$$R(\uparrow)T = 0.4g$$

$$T = \frac{10e}{0.5} = 20e$$

$$\therefore 20e = 0.4g$$

For the oscillations:

$$F = ma$$

$$0.4g - T = 0.4 \,\tilde{x}$$

Hooke's Law: $T = \frac{\lambda x}{r}$

$$T = \frac{10(e+x)}{0.5}$$

$$\therefore \ 0.4g - \frac{10(e+x)}{0.5} = 0.4 \ \ddot{x}$$

From above
$$0.4g = \frac{10e}{0.5}$$

$$\therefore -\frac{10x}{0.5} = 0.4 \ddot{x}$$

$$\ddot{x} = -\frac{20x}{0.4} = -50x$$

 \therefore S.H.M. with $\omega^2 = 50$

amplitude = 0.2 m

$$x = a \cos \omega t$$

$$x = 0.2\cos\sqrt{50}t$$

String becomes slack when x = -e

$$-\frac{0.4g}{20} = 0.2\cos\sqrt{50}t$$

$$\cos\sqrt{50}t = -\frac{2g}{20} = -\frac{g}{10} = -0.98$$

$$\sqrt{50t} = \cos^{-1}(-0.98)$$

$$t = \frac{1}{\sqrt{50}} \cos^{-1}(-0.98)$$

$$t = 0.4159$$

The string becomes slack after 0.416s (3 s.f.)

b
$$v^2 = \omega^2(a^2 - x^2)$$

$$x = -e = -\frac{0.4}{20}g$$
Find the speed when the string becomes slack.

$$v^2 = 50 \left(0.2^2 - \left(\frac{0.4}{20} g \right)^2 \right)$$

$$v^2 = 0.0792$$

$$v = u + at$$

$$\sqrt{0.0792} = -\sqrt{0.0792} + 9.8t$$
The particle moves freely under gravity while the string is slack.

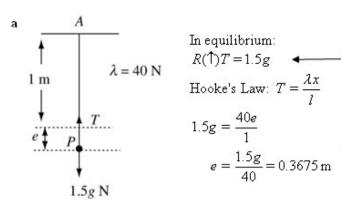

$$t = \frac{2\sqrt{0.0792}}{9.8} = 0.05743...$$
The string is slack for 0.0574 s (3 s.f.)

Further dynamics Exercise E, Question 8

Question:

A particle P of mass 1.5 kg is hanging freely attached to one end of a light elastic string of natural length 1 m and modulus of elasticity 40 N. The other end of the string is attached to a fixed point A on a ceiling. The particle is pulled vertically downwards until AP is 1.8 m and released from rest. When P has risen a distance 0.4 m the string is cut.

- a Calculate the greatest height P reaches above its equilibrium position.
- b Calculate the time taken from release to reach that greatest height.

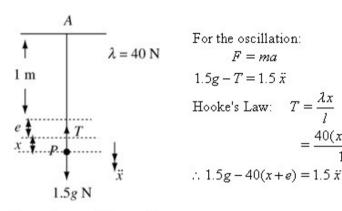

In equilibrium:

$$R(\uparrow)T = 1.5g$$

Hooke's Law: $T = \frac{\lambda x}{l}$
 $1.5g = \frac{40e}{1}$

 $e = \frac{1.5g}{40} = 0.3675 \,\mathrm{m}$

a can be done by using conservation of energy but b needs S.H.M. So S.H.M. has been used for both parts.

$$F = ma$$

$$1.5g - T = 1.5 i$$

Hooke's Law:
$$T = \frac{\lambda x}{l}$$
$$= \frac{40(x+e)}{1}$$
$$\therefore 1.5g - 40(x+e) = 1.5 \ddot{x}$$

From above
$$1.5g = 40e$$

 $\therefore 1.5 \ddot{x} = -40x$

$$\ddot{x} = -\frac{80}{3}x$$

$$\omega = \sqrt{\frac{80}{3}}$$

amplitude = 0.8 - 0.3675 = 0.4325 m

$$v^2 = \omega^2 (a^2 - x^2)$$

When the string is cut: x = 0.4325 - 0.4

and
$$v^2 = \frac{80}{3}(0.4325^2 - 0.0325^2)$$

= 4.96

Find the speed when the string is

motion under gravity:

$$v^2 = u^2 + 2as$$
 \leftarrow 0 = 4.96 - 2 x 9.8s

Use motion under gravity.

$$s = \frac{4.96}{2 \times 9.8} = 0.2530...$$

height above equilibrium position = 0.2530 - 0.0325 = 0.2205

Height is 0.221 m.

b For S.H.M.
$$x = a \cos \alpha t$$
 Particle starts from an end-point. $x = 0.4325 \cos \sqrt{\frac{80}{3}}t$ $x = 0.0325 \quad 0.0325 = 0.4325 \cos \sqrt{\frac{80}{3}}t$ $\cos \sqrt{\frac{80}{3}}t = \frac{0.0325}{0.4325}$ $t = \sqrt{\frac{3}{80}} \cos^{-1} \left(\frac{0.0325}{0.4325}\right)$ $t = 0.2896$

Motion under gravity:

$$v = u + at$$

$$O = \sqrt{4.96} - 9.8t$$

$$t = \frac{\sqrt{4.96}}{9.8}$$

total time = $0.2896... + \frac{\sqrt{4.96}}{9.8} = 0.5168...$

The time taken to reach the highest point is 0.517s (3 s.f.)

Solutionbank M3

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise E, Question 9

Ouestion:

A particle P of mass 1.5 kg is attached to the mid-point of a light elastic string of natural length 1.2 m and modulus of elasticity 15 N. The ends of the string are fixed to the points A and B where A is vertically above B and $AB = 2.8 \,\mathrm{m}$.

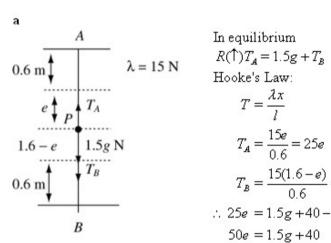

a Given that P is in equilibrium calculate the length AP.

The particle is now pulled downwards a distance 0.15 m from its equilibrium position and released from rest.

b Prove that P moves with simple harmonic motion. T seconds after being released P is 0.1 m above its equilibrium position.

c Find the value of T.

Solution:

$$R(\uparrow)T_A = 1.5g + T_B$$

$$T = \frac{\lambda x}{l}$$

$$T_A = \frac{15e}{0.6} = 25e$$

$$T_B = \frac{15(1.6 - e)}{0.6} = 40 - 25e$$

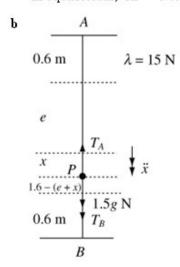

You must consider P to be attached to two strings. The tensions in the two parts will be different.

$$\therefore 25e = 1.5g + 40 - 25e$$

$$50e = 1.5g + 40$$

$$e = \frac{1}{50}(1.5g + 40) = 1.094$$

In equilibrium, AP = 1.69 m (3 s.f.)

For the oscillations:

$$\lambda = 15 \text{ N}$$
 $T_A = \frac{15(e+x)}{0.6}$

$$T_{B} = \frac{15(1.6 - (e + x))}{0.6}$$

$$F = ma$$

$$1.5g + \frac{15(1.6 - (e + x))}{0.6} - \frac{15(e + x)}{0.6} = 1.5 \ \tilde{x}$$

$$1.5g + 40 - 25(e + x) - 25(e + x) = 1.5 \ddot{x}$$

$$1.5g + 40 - 50e - 50x = 1.5 \ddot{x}$$

from a
$$50e = 1.5g + 40$$

$$\therefore 1.5 \ddot{x} = -50x$$

$$\ddot{x} = -\frac{50}{1.5}x = -\frac{100}{3}x$$

.. P moves with S.H.M.

c amplitude =
$$0.15 \, \text{m}$$

$$x = a \cos \omega t = 0.15 \cos \left(\frac{10}{\sqrt{3}}\right) t$$
When $x = -0.1$
The equilibrium position is the centre of the oscillation.
$$-0.1 = 0.15 \cos \left(\frac{10}{\sqrt{3}}T\right)$$

$$\cos \left(\frac{10}{\sqrt{3}}T\right) = -\frac{0.1}{0.15}$$

$$T = \frac{\sqrt{3}}{10} \cos^{-1} \left(-\frac{0.1}{0.15}\right)$$

© Pearson Education Ltd 2009

= 0.3984... $\therefore T = 0.398 \quad (3 \text{ s.f.})$

Further dynamics Exercise E, Question 10

Ouestion:

A rock climber of mass 70 kg is attached to one end of a rope. He falls from a ledge which is 8 m vertically below the point to which the other end of the rope is fixed. The climber falls vertically without hitting the rock face. Assuming that the climber can be modelled as a particle and the rope as a light elastic string of natural length 16 m and modulus of elasticity 40 000 N, calculate

- a the climber's speed at the instant when the rope becomes taut,
- b the maximum distance of the climber below the ledge,
- c the time from falling from the ledge to reaching his lowest point.

a Until rope is taut:

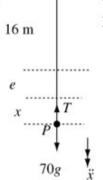

$$v^2 = u^2 + 2as$$

$$v^2 = 0 + 2 \times 9.8 \times 8$$

$$v = 12.52...$$

When the rope becomes taut the climber's speed is $12.5\,\mathrm{m\ s^{-1}}$ (3 s.f.)

b At the equilibrium level:

Hooke's Law:
$$T = \frac{\lambda x}{l}$$

$$T = \frac{40\ 000e}{16}$$

$$R(\uparrow)T = 70g$$

$$\therefore 70g = \frac{40\,000e}{16}$$

$$e = \frac{16 \times 70g}{40\,000} = \frac{7g}{250}$$

b can be solved by using conservation of energy.
However c involves time, so S.H.M. methods are needed. It is more efficient to use S.H.M. for both parts.

Climber falling freely under

gravity.

For the oscillation:

$$F = ma$$

$$70g - T = 70 \,\ddot{x}$$

Hooke's Law:
$$T = \frac{40\ 000(x+e)}{16}$$

$$70g - \frac{40\ 000(x+e)}{16} = 70\ \ddot{x}$$
$$\ddot{x} = -\frac{4000}{16 \times 7}x = -\frac{250}{7}x$$

From **a**:
$$70g = \frac{40\,000e}{16}$$

$$\omega^2 = \frac{250}{7}$$

$$v^2 = \omega^2 (\alpha^2 - x^2)$$

$$156.8 = \frac{250}{7} \left(a^2 - \left(\frac{7g}{250} \right)^2 \right)$$

Use the result from part a, ie the speed when
$$x = e \left(= \frac{7g}{250} \right)$$
.

$$a^2 = \frac{156.8 \times 7}{250} + \left(\frac{7g}{250}\right)^2$$

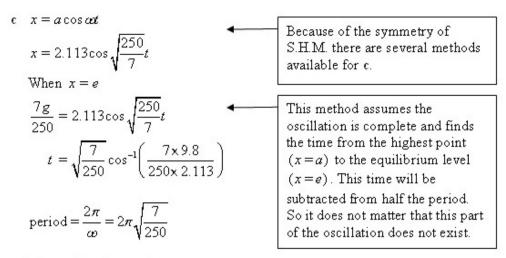

$$a^2 = 4.4656...$$

$$\alpha = 2.113...$$

Total distance = 2.113 + e + 8= $2.113 + \frac{7g}{250} + 8$

The amplitude is the greatest distance below the equilibrium level.

The total distance fallen is 10.4 m (3 s.f.).

Time while the rope is taut:

$$= \frac{2\pi}{2} \sqrt{\frac{7}{250}} - \sqrt{\frac{7}{250}} \cos^{-1} \left(\frac{7 \times 9.8}{250 \times 2.113} \right)$$
Time from highest point to lowest point of a complete oscillation is half the period. Subtract the time for the missing part (before the rope is taut) to obtain the time while the rope is taut.

The time before the rope becomes

taut is also needed.

While moving under gravity: $s = ut + \frac{1}{2}at^2$

$$8 = \frac{1}{2} \times 9.8t^2$$

$$t^2 = \frac{16}{9.8}$$

total time =
$$\frac{4}{\sqrt{9.8}} + 0.2846...$$

= 1.562...

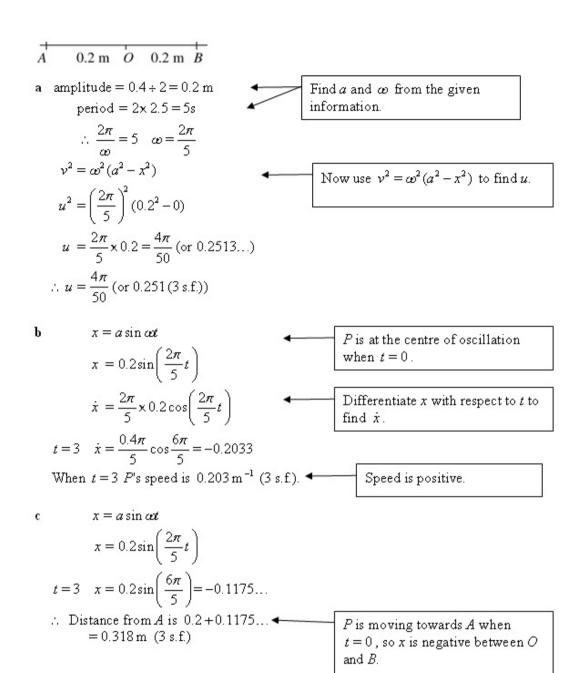

The total time is 1.56s (3 s.f.).

Further dynamics Exercise F, Question 1

Question:

A particle P is moving with simple harmonic motion between two points A and B which are 0.4 m apart on a horizontal line. The mid-point of AB is O. At time t=0, P passes through O, moving towards A, with speed u m s⁻¹. The next time P passes through O is when t=2.5 s.

- a Find the value of u.
- **b** Find the speed of P when t = 3s.
- c Find the distance of P from A when t = 3s.

Solutionbank M3

Edexcel AS and A Level Modular Mathematics

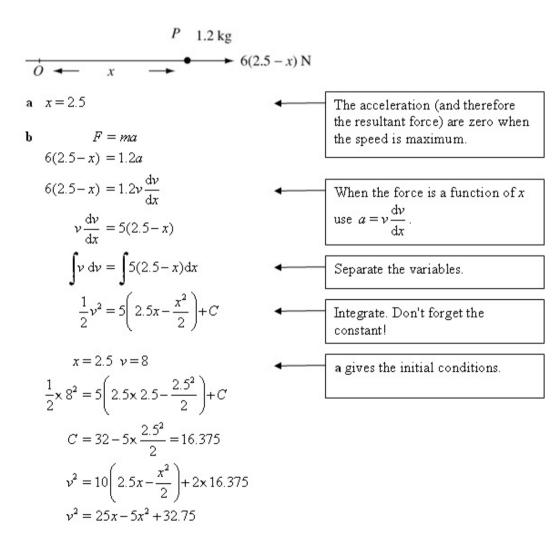

Further dynamics Exercise F, Question 2

Ouestion:

A particle P of mass 1.2 kg moves along the x-axis. At time t = 0, P passes through the origin O, moving in the positive x-direction. At time t seconds, the velocity of P is v m s⁻¹ and OP = x metres. The resultant force acting on P has magnitude 6(2.5 - x)N and acts in the positive x-direction. The maximum speed of P is 8 m s⁻¹.

- a Write down the value of x when the speed of P is 8 m s^{-1} .
- **b** Find an expression for v^2 in terms of x.

Solution:

Further dynamics Exercise F, Question 3

Question:

A particle P of mass 0.6 kg moves along the positive x-axis under the action of a single force which is directed towards the origin O and has magnitude $\frac{k}{(x+2)^2}$ N

where OP = x metres and k is a constant. Initially P is moving away from O. At x = 2 the speed of P is 8 m s^{-1} and at x = 10 the speed of P is 2 m s^{-1} .

a Find the value of k.

The particle first comes to instantaneous rest at the point B.

b Find the distance OB.

$$F = ma$$

$$-\frac{k}{(x+2)^2} = 0.6a$$

$$0.6v \frac{dv}{dx} = -\frac{k}{(x+2)^2}$$

$$0.6 \int v \, dv = -\int \frac{k}{(x+2)^2} \, dx$$

$$0.3v^2 = \frac{k}{(x+2)} + c$$

$$x = 2, v = 8 \quad 0.3x \, 8^2 = \frac{k}{4} + c$$

$$x = 10, v = 2 \quad 0.3x \, 2^2 = \frac{k}{12} + c$$

Subtract:
$$0.3(8^2 - 2^2) = \frac{k}{4} - \frac{k}{12}$$

 $0.3 \times 60 = \frac{k}{6}$
 $k = 0.3 \times 60 \times 6 = 108$

The force is a function of x so use $a = v \frac{dv}{dx}.$

Separate the variables and integrate.

Use the given information to obtain a pair of simultaneous equations in k and c.

Find c to complete the expression

Solve to find k.

b From above
$$0.3 \times 4 = \frac{k}{12} + c$$

$$c = 1.2 - \frac{108}{12} = -7.8$$
$$\therefore 0.3v^2 = \frac{108}{(x+2)} - 7.8$$

 $v = 0 \quad 0 = \frac{108}{x+2} - 7.8$

7.8(x+2) = 108 $x = \frac{108}{7.8} - 2 = 11.84...$

The distance *OB* is 11.8 m (3 s.f.).

Further dynamics Exercise F, Question 4

Question:

A particle P moves along the x-axis in such a way that at time t seconds its distance x metres from the origin O is given by $x = 3\sin\left(\frac{\pi t}{4}\right)$.

- a Prove that P moves with simple harmonic motion.
- b Write down the amplitude and the period of the motion.
- c Find the maximum speed of P.

The points A and B are on the same side of O with $OA = 1.2 \,\mathrm{m}$ and $OB = 2 \,\mathrm{m}$.

d Find the time taken by P to travel directly from A to B.

a
$$x = 3\sin\left(\frac{\pi}{4}t\right)$$

 $\dot{x} = \frac{3\pi}{4}\cos\left(\frac{\pi}{4}t\right)$
Differentiate $x = 3\sin\left(\frac{\pi}{4}t\right)$ twice.
$$\ddot{x} = -3\left(\frac{\pi}{4}\right)^2\sin\left(\frac{\pi}{4}t\right)$$

$$\ddot{x} = -\left(\frac{\pi}{4}\right)^2x$$
Obtain an equation of the form $\ddot{x} = -\omega^2x$.
$$\therefore \text{ S.H.M.}$$

b amplitude = 3 m

period =
$$\frac{2\pi}{\omega} = 2\pi \times \frac{4}{\pi} = 8s$$

c From a
$$\dot{x} = \frac{3\pi}{4} \cos\left(\frac{\pi}{4}t\right)$$

 $\Rightarrow \text{maximum speed} = \frac{3\pi}{4} \text{ m s}^{-1}$
(or 2.36 m s⁻¹ (3 s.f.))

d O 1.2 m A 0.8 m B

$$x = 3\sin\left(\frac{\pi}{4}t\right)$$
At A, $x = 1.2$ $1.2 = 3\sin\left(\frac{\pi}{4}t_a\right)$

$$t_a = \frac{4}{\pi}\sin^{-1}\left(\frac{1.2}{3}\right)$$

At B,
$$x = 2$$
 $t_b = \frac{4}{\pi} \sin^{-1} \left(\frac{2}{3}\right)$

Time
$$A \to B = \frac{4}{\pi} \left[\sin^{-1} \left(\frac{2}{3} \right) - \sin^{-1} \left(\frac{1.2}{3} \right) \right]$$

$$= 0.4051$$
Leave calculator work as late as possible.

Or use $v_{\max} = a\omega$.

The time to go directly from A to B is 0.405 s (3 s.f.)

Further dynamics Exercise F, Question 5

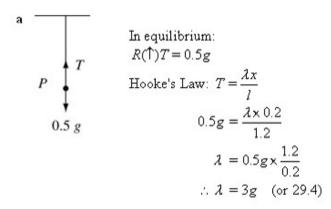

Ouestion:

A particle P of mass 0.5 kg is attached to one end of a light elastic string of natural length 1.2 m and modulus of elasticity λ N. The other end of the string is attached to a fixed point A. The particle is hanging in equilibrium at the point O, which is 1.4 m vertically below A.

a Find the value of λ .

The particle is now displaced to a point B, 1.75 m vertically below A, and released from rest

- b Prove that while the string is taut P moves with simple harmonic motion.
- c Find the period of the simple harmonic motion.
- d Calculate the speed of P at the first instant when the string becomes slack.
- e Find the greatest height reached by P above O.

b 1.2 m 0.2 m T Hooke's Law: $T = \frac{\lambda x}{l}$

For oscillations:

$$F = ma$$

$$T = 0.55$$

$$0.5g - T = 0.5 \ddot{x}$$

Hooke's Law:
$$T = \frac{\lambda x}{l}$$
$$T = \frac{3g(0.2 + x)}{1.2}$$

$$0.5g - \frac{3g(0.2+x)}{1.2} = 0.5 \ddot{x}$$

$$\ddot{x} = -\frac{3g}{0.5 \times 1.2} x = -5gx$$

Of form $\ddot{x} = \omega^2 x$

.. S.H.M.

 $period = \frac{2\pi}{\omega} = \frac{2\pi}{\sqrt{5g}} = 0.8975...$

The period is 0.898s (3 s.f.).

From $\ddot{x} = -5gx$.

d String becomes slack when x = -0.2 m.

amplitude = 0.35 m

$$v^2 = \omega^2 (\alpha^2 - x^2)$$

$$v^2 = 5g(0.35^2 - 0.2^2)$$

$$v = 2.010...$$

The speed is $2.01 \,\mathrm{m \ s^{-1}}$ (3 s.f.).

Use the exact value for ω^2 .

 $e \quad v^2 = u^2 + 2as$ $0 = 2.010^2 - 2 \times 9.8s$ $s = \frac{2.010^2}{2 \times 9.9} = 0.2061...$

Once the string is slack the particle moves freely under gravity.

Distance above O = 0.2 + 0.2061... $= 0.406 \, \text{m} \, (3 \, \text{s.f.})$

The particle is 0.2 m above O when the string becomes slack.

Solutionbank M3

Edexcel AS and A Level Modular Mathematics

Further dynamics Exercise F, Question 6

Ouestion:

A spacecraft S of mass m is moving in a straight line towards the centre of the Earth. When the distance of S from the centre of the Earth is x metres, the force exerted by

the Earth on S has magnitude $\frac{k}{x^2}$, where k is a constant, and is directed towards the centre of the Earth.

a By modelling the Erth as a sphere of radius R and S as a particle, show that $k = mgR^2$.

The space craft starts from rest when x = 5R.

b Assuming that air resistance can be ignored find the speed of S as it crashes onto the Earth's surface.

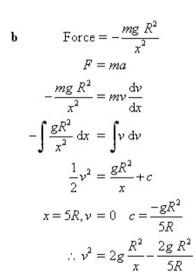

Solution:

a
$$F = \frac{k}{x^2}$$

when $x = R, F = mg$
 $\therefore \frac{k}{R^2} = mg, \quad k = mg R^2$

When x = R, S is on the surface of the Earth and the force exerted by the Earth on S is mg.

The force is in the direction of

The force is a function of x so use $a = v \frac{dv}{dx}.$

decreasing x.

When
$$x = R$$
 $v^2 = 2g \frac{R^2}{R} - \frac{2g R^2}{5R}$
 $v^2 = \frac{8Rg}{5}$

The speed of the spacecraft is

$$\sqrt{\left(\frac{8Rg}{5}\right)}$$
 or $2\sqrt{\left(\frac{2Rg}{5}\right)}$

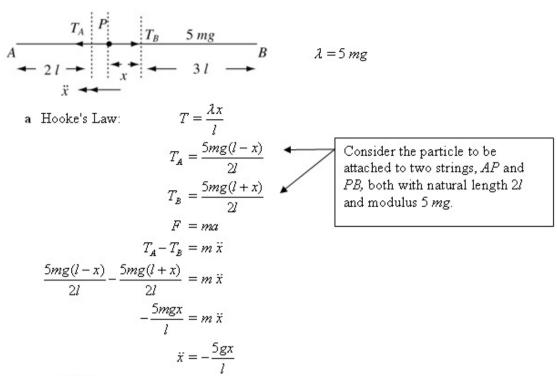

Further dynamics Exercise F, Question 7

Question:

A particle P of mass m is attached to the mid-point of a light elastic string of natural length 4l and modulus of elasticity 5mg. One end of the string is attached to a fixed point A and the other end to a fixed point B, where A and B lie on a smooth horizontal surface and AB = 6l. The particle is held at the point C where A, C and B are collinear and $AC = \frac{9l}{4}$, and released from rest.

a Prove that P moves with simple harmonic motion. Find, in terms of g and l,

- b the period of the motion,
- c the maximum speed of P.

.: S.H.M.

b
$$\omega^2 = \frac{5g}{l}$$
 period $= \frac{2\pi}{\omega} = 2\pi \sqrt{\frac{l}{5g}}$
The period is $2\pi \sqrt{\frac{l}{5g}}$

Find the amplitude from the given information.
$$v^2 = \omega^2(a^2 - x^2)$$

$$v_{\max} = \omega a = \sqrt{\frac{5g}{l}} \times \frac{3l}{4} = \frac{3}{4} \sqrt{5gl}$$
 Maximum speed when $x = 0$. The maximum speed is $\frac{3}{4} \sqrt{5gl}$.

Further dynamics Exercise F, Question 8

Question:

A particle P of mass 0.5 kg is moving along the x-axis, in the positive x-direction. At time t seconds (where $t \ge 0$) the resultant force acting on P has magnitude

$$\frac{5}{\sqrt{(3t+4)}}$$
 N and is directed towards the origin O. When $t=0$, P is moving through O

with speed 12 m s⁻¹.

- a Find an expression for the velocity of P at time t seconds.
- b Find the distance of P from O when P is instantaneously at rest.

a
$$\frac{5}{\sqrt{(3l+4)}} \text{N} \quad P \quad 0.5 \text{ kg}$$

$$F = ma$$

$$-\frac{5}{\sqrt{(3l+4)}} = 0.5 \tilde{x}$$

$$\tilde{x} = -10(3l+4)^{-\frac{1}{2}}$$

$$\dot{x} = -\frac{10}{\frac{1}{2} \times 3} (3l+4)^{\frac{1}{2}} + c$$

$$t = 0 \quad \dot{x} = 12 \quad 12 = -\frac{20}{3} \sqrt{4} + c$$

$$c = 12 + \frac{40}{3} = \frac{76}{3}$$

$$\therefore \dot{x} = -\frac{20}{3} (3l+4)^{\frac{3}{2}} + \frac{76}{3}$$
b
$$x = -\frac{20}{3 \times \frac{3}{2} \times 3} (3l+4)^{\frac{3}{2}} + \frac{76}{3} l + A$$

$$t = x = 0 \therefore A = \frac{40}{27} \times 4^{\frac{3}{2}} = \frac{320}{27}$$

$$P \text{ at rest} \Rightarrow \frac{76}{3} = \frac{20}{3} (3l+4)^{\frac{1}{2}}$$

$$\left(\frac{76}{20}\right)^2 = 3l + 4$$

$$t = \frac{1}{3} \left[\left(\frac{76}{20}\right)^2 - 4 \right]$$

$$t = 3.48$$
When $t = 3.48$

$$x = -\frac{40}{27} \left(\frac{76}{20}\right)^3 + \frac{76}{3} \times 3.48 + \frac{320}{27}$$

$$x = 18.72$$
Using result from a.
$$3l + 4 = \left(\frac{76}{20}\right)^2, \text{ so use the exact value here.}$$

P is 18.7 m from O (3 s.f.)

Further dynamics Exercise F, Question 9

Question:

A particle P of mass 0.6 kg is attached to one end of a light elastic spring of natural length 2.5 m and modulus of elasticity 25 N. The other end of the spring is attached to a fixed point A on the smooth horizontal table on which P lies. The particle is held at the point B where AB=4 m and released from rest.

- a Prove that P moves with simple harmonic motion.
- b Find the period and amplitude of the motion.
- Find the time taken for P to move 2 m from B.

Solution:

A
$$T$$
 P 0.6 kg $\lambda = 25 \text{ N}$

a
$$F = ma$$

 $-T = 0.6 \text{ } \ddot{x}$

Hooke's Law:
$$T = \frac{\lambda x}{l}$$

$$T = \frac{25}{2.5}x = 10x$$

$$\therefore 0.6 \ \ddot{x} = -10x$$

$$\ddot{x} = -\frac{10}{0.6}x$$

∴ S.H.M.

b
$$\omega^2 = \frac{10}{0.6}$$

period = $\frac{2\pi}{\omega} = 2\pi \sqrt{\frac{0.6}{10}} = 1.539...$
period = 1.54 s (3 s.f.)
amplitude = $(4-2.5)$ m = 1.5 m

$$x = a \cos \alpha t$$

$$x = 1.5 \cos \left(\sqrt{\frac{10}{0.6}} t \right)$$

$$x = -0.5 \text{m} \quad -0.5 = 1.5 \cos \left(\sqrt{\frac{10}{0.6}} t \right)$$

$$D \text{ is on the other side of the centre from } O \text{ so } x \text{ is negative.}$$

$$t = \sqrt{\frac{0.6}{10}} \cos^{-1} \left(-\frac{0.5}{1.5} \right) = 0.4680 \dots$$

P takes 0.468s to move 2 m from B (3 s.f.).

Further dynamics Exercise F, Question 10

Ouestion:

A particle P of mass 0.4 kg is attached to the mid-point of a light elastic string of natural length 1.2 m and modulus of elasticity 2.5 N. The ends of the string are attached to points A and B on a smooth horizontal table where AB = 2 m. The particle P is released from rest at the point C on the table, where A, C and B lie in a straight line and AC = 0.7 m.

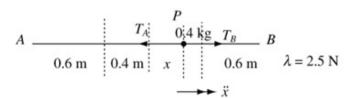

- a Show that P moves with simple harmonic motion.
- b Find the period of the motion.

The point D lies between A and B and $AD = 0.85 \,\mathrm{m}$.

c Find the time taken by P to reach D for the first time.

Consider P to be attached to two strings, each of natural length

0.6 m and modulus 2.5 N.

a
$$F = ma$$

$$T_{\rm p} - T_{\rm d} = 0.4 \ \ddot{x}$$

Hooke's Law:
$$T = \frac{\lambda x}{l}$$

$$T_A = \frac{2.5(0.4+x)}{0.6}$$

$$T_B = \frac{2.5(0.4 - x)}{0.6}$$

$$\therefore \frac{2.5(0.4-x)}{0.6} - \frac{2.5(0.4+x)}{0.6} = 0.4 \ \ddot{x}$$
$$-2x \frac{2.5x}{0.6} = 0.4 \ \ddot{x}$$

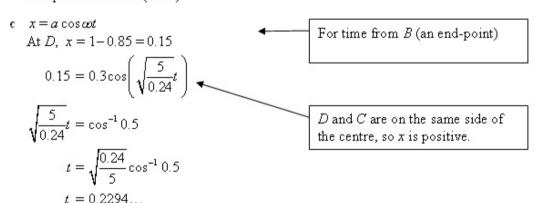

$$\ddot{x} = -\frac{2 \times 2.5}{0.6 \times 0.4} x$$

: S.H.M

b
$$\omega^2 = \frac{2 \times 2.5}{0.6 \times 0.4} = \frac{5}{0.24}$$

period = $\frac{2\pi}{\omega} = 2\pi \sqrt{\frac{0.24}{5}} = 1.376...$

The period is 1.38s (3 s.f.)

P takes 0.229s (3 s.f.) to reach D.
