

**Q.2** a. Evaluate  $\lim_{x \rightarrow 0} \frac{\sin 2x + \sin 6x}{\sin 5x - \sin 3x}$

**Answer**

$$\begin{aligned} \text{Here we have, } & \lim_{x \rightarrow 0} \frac{\sin 2x + \sin 6x}{\sin 5x - \sin 3x} \\ &= \lim_{x \rightarrow 0} \frac{2 \sin\left(\frac{2x+6x}{2}\right) + \cos\left(\frac{2x-6x}{2}\right)}{2 \cos\left(\frac{5x+3x}{2}\right) \cdot \sin\left(\frac{5x-3x}{2}\right)} \\ &= \lim_{x \rightarrow 0} \frac{\sin 4x \cos(-2x)}{\cos 4x \cdot \cos x} \\ &= \lim_{x \rightarrow 0} 4 \left( \frac{\sin 4x}{4x} \right) \left( \frac{x}{\sin x} \right) \left( \frac{\cos 2x}{\cos 4x} \right) \\ &= 4(1)(1)(1) = 4 \end{aligned}$$

b. If  $f$  is a real function defined by  $f(x) = \frac{x-1}{x+1}$  then prove that

$$f(2x) = \frac{3f(x)+1}{f(x)+3}$$

**Answer**

$$f(x) = \frac{x-1}{x+1}, f(x) + 1$$

$$= \frac{x-1}{x+1} + 1 = \frac{(x-1)+(x+2)}{(x+1)}$$

$$f(x) - 1 = \frac{x-1}{x+1} - 1 = \frac{x-1+x+1}{x+1}$$

$$\Rightarrow \text{then } \frac{f(x)+1}{f(x)-1} = \frac{x-1+x+1}{x+1}$$

(Applying componendo & devidendo)

$$\Rightarrow x = \frac{f(x)+1}{1-f(x)}, \text{ Now, } f(2x) = \frac{2x-1}{2x+1}$$

$$\Rightarrow f(2x) = \frac{\left\{ \frac{f(x)+1}{1-f(x)} \right\} - 1}{2 \left\{ \frac{f(x)+1}{1-f(x)} \right\} + 1}$$

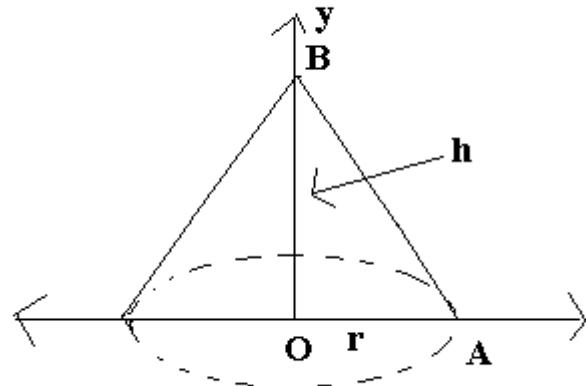

$$= \frac{2f(x) + 2 - 1 + f(x)}{2f(x) + 2 + 1 - f(x)}$$

$$\Rightarrow f(2x) = \frac{3f(x) + 1}{f(x) + 3} \quad \text{There proof}$$

- Q.3** a. Find the volume of the right circular cone formed by the revolution of a right angled triangle about a side which contains the right angle.

**Answer**

Let OBA be the right angled with OA = r and OB = h. When the triangle is revolved about the side y-axis is about the side OB. We get a right circular cone of radius r and height h.

The curve is the line AB, whose eqn. is

$$\frac{x}{r} + \frac{y}{h} = 1$$

or  $x = \frac{r}{h}(h-y)$  \_\_\_\_\_ (i)

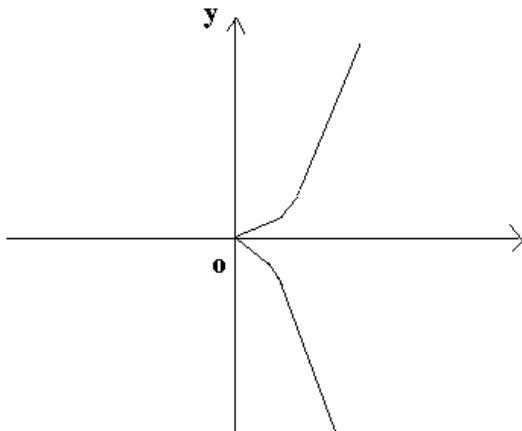

$$\text{Required volume} = \pi \int_0^{\pi} \frac{r^2}{h^2} (h-y)^2 dy$$

$$\begin{aligned}
 &= \frac{\pi r^2}{h^2} \left[ -\frac{(h-y)^3}{3} \right]^h \\
 &= \frac{\pi r^2}{h^2} \left[ 0 + \frac{h^3}{3} \right]^0 = \frac{1}{3} \pi r^2 h
 \end{aligned}$$

- b. Find the length of the curve  $y^2 = x^3$  from origin to the point (1, 1).

**Answer**

The curve can easily be traced and its shape is shown in below figure  
The eqn. of the curve is  $y^2 = x^3$  \_\_\_\_\_ (i)

$$\begin{aligned}
 y^2 &= x^3 \\
 \therefore 2y \frac{dy}{dx} &= 3x^2 \\
 \text{or } \frac{dy}{dx} &= \frac{3x^2}{2y} = \frac{3x^2}{2x^{3/2}} = \frac{3}{2} x^{1/2} [\text{from(i)}]
 \end{aligned}$$

$$\text{Now, } S = \int_0^1 \sqrt{1 + \left( \frac{dy}{dx} \right)^2} dx = \int_0^1 \sqrt{1 + \left( \frac{9x}{4} \right)} dx$$

$$\begin{aligned}
 &= \frac{1}{2} \int_0^1 \sqrt{4+9x} dx \\
 &= \frac{1}{2} \left[ \frac{1}{9} \times \frac{2}{3} (4+9x)^{3/2} \right]_0^1
 \end{aligned}$$

$$= \frac{1}{27} [(13)^{3/2} - (4)^{3/2}]$$

$$= \frac{1}{27} [13\sqrt{13} - 8]$$

- Q.4** a. If  $n$  is a positive integer then show that  $(\sqrt{3} + i)^n + (\sqrt{3} - i)^n = 2^{n+1} \cos \frac{n\pi}{6}$   
where  $i = \sqrt{-1}$

**Answer**

Let

$$\sqrt{3} + i = r(\cos \alpha + i \sin \alpha)$$

$$r = \sqrt{3+1=2}, \alpha = \tan^{-1}\left(\frac{1}{\sqrt{3}}\right) = \frac{\pi}{6}$$

$$\sqrt{3} + i = 2 \left[ \cos \frac{\pi}{6} + i \sin \frac{\pi}{6} \right]$$

$$\begin{aligned} (\sqrt{3} + i)^n + (\sqrt{3} - i)^n &= \left[ 2 \left( \cos \frac{\pi}{6} + i \sin \frac{\pi}{6} \right) \right]^n + \left[ 2 \left( \cos \frac{\pi}{6} - i \sin \frac{\pi}{6} \right) \right]^n \\ &= 2^n \left( \cos \frac{n\pi}{6} + i \sin \frac{n\pi}{6} \right) + 2^n \left( \cos \frac{n\pi}{6} - i \sin \frac{n\pi}{6} \right) \end{aligned}$$

$$= 2^{n+1} \cos \frac{n\pi}{6} \quad \text{R.H.S. Hence proved}$$

- b. A resistance of 20 ohms and inductance of 0.2 H and a capacitance of  $100 \mu\text{F}$  are connected in series across 220 Volt, 50cycle/sec main.  
Determine: (i) impedance (ii) current  
(iii) voltage across L, R and C (iv) power in watt  
(v) power factor

**Answer** There,  $R = 20\Omega$ 

$$L = 0.2 \text{ H}$$

$$C = 100 \mu\text{f}$$

$$V = 200\text{V}$$

$$f = 50 \text{ c/s}$$

- (a) Impedance ( $z$ ) =  $R - j \times C + j \times L$

$$= 20 - j \frac{1}{WC} + j LW$$

$$\begin{aligned}
 &= 20 - j \frac{1}{50 \times 2\pi \times 100 \times 10^{-6}} + j(0.2)2\pi \times 50 \\
 &= 20 - J \frac{100}{\pi} + J20\pi = 20 - j 31.831 + J 62.8319 \\
 &= 20 + J 31
 \end{aligned}$$

So.  $|Z| = \sqrt{400+961} = \sqrt{1361}$

$|Z| = 36.89$  ohms.

(b)  $i = \frac{v}{|z|} = \frac{200}{36.89} = 5.42$

(c)  $V_L = i \times L$

$$= 5.42 \times 2\pi f \times 0.2$$

$$= 5.42 \times 2 \times \pi \times 50 \times 0.2$$

$$V_R = iR = 5.42 \times 20 = 108.4 \text{ volts}$$

$$V_c = i \times \frac{1}{2\pi f \times c} = \frac{5.42 \times 1}{2 \times \pi \times 50 \times 100 \times 10^{-6}} = 172.52 \text{ volts}$$

(d) Power =  $i^2 R$   
 $= (5.42)^2 \times 20 = 587.528$  watts.

(e) Power factor =  $\frac{R}{|z|} = \frac{20}{36.89} = 0.542$

- Q.5** a. A rigid body is spinning with an angular velocity of 27 radian/second about an axis parallel to  $2i + j - 2k$  passing through the point  $i + 3j - k$ . Find the velocity of the point whose position vector is  $4i + 8j + k$ .

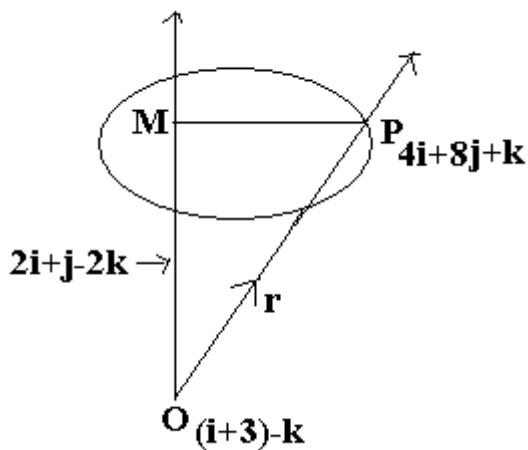

**Answer**

Let  $\vec{w}$  be the angular of the body rotating about an axis parallel to the vector  $2i + j - 2k$ .

Then  $\vec{w} = 27 \times \frac{2i + j - 2k}{\sqrt{2^2 + 1^2 + (-2)^2}}$

$$\vec{w} = 18i + 9j - 18k$$

Let  $\vec{r} = \overrightarrow{OP} = \text{P.V. of } \vec{P} \quad \text{P.V. of } \vec{O}$

$$\vec{r} = (4i + 8j + k) - (i + 3j - k)$$

$$\vec{r} = 3i + 5j + 2k$$

$$\text{Let } \vec{u} = \vec{w} \times \vec{r} = \begin{vmatrix} i & j & k \\ 18 & 9 & -18 \\ 3 & 5 & 2 \end{vmatrix}$$

$$\Rightarrow \vec{u} = 108i - 90j + 63k$$

$$= 9(12i - 10j + 7k)$$

- b. Find the area of the triangle formed by the point whose position vectors are  $3i+j$ ,  $5i+2j+k$ ,  $i-2j+3k$ .

**Answer** Let ABC be a triangle and let  $\vec{a} = 3i + j$ ,  $\vec{b} = 5i + 2j + k$ , and  $\vec{c} = i - 2j + 3k$  be the position vectors of its vertices A, B, and C respectively, then

$$\vec{AB} = \text{P.V. of } B - \text{P.V. of } A$$

$$= (5i + 2j + k) - (3i + j) = 2i + j + k$$

$$\text{and } \vec{AC} = \text{P.V. of } C - \text{P.V. of } A$$

$$= (i - 2j + 3k) - (3i + j) = -2i - 3j + 3k$$

$$\vec{AB} \times \vec{AC} = \begin{vmatrix} i & j & k \\ 2 & 1 & 1 \\ -2 & -3 & 3 \end{vmatrix} = 6i - 8j - 4k$$

$$\Rightarrow |\vec{AB} \times \vec{AC}| = \sqrt{36 + 64 + 16} = \sqrt{116}$$

$$\therefore \text{Reqd. Area} = \frac{1}{2} |\vec{AB} \times \vec{AC}| = \frac{1}{2} \sqrt{116} = \sqrt{29}$$

$$(\text{formula, Area of } \Delta ABC = \frac{1}{2} |\vec{AB} \times \vec{AC}| = \frac{1}{2} |\vec{BC} \times \vec{BA}| = \frac{1}{2} |\vec{CA} \times \vec{CB}|)$$

**Q.6** a. Solve  $\frac{d^2y}{dx^2} - 6\frac{dy}{dx} + 9y = 6e^{3x} + 7e^{-2x} - \log 2$

**Answer**

$$\frac{d^2y}{dx^2} + 6\frac{dy}{dx} + 9y = 5e^{3x}$$

$$(D^2 + 6D + 9)y = 5e^{3x}$$

Auxiliary equation is  $D^2 + 6D + 9 = 0$  or  $D = -3, -3$ ,  
C.F. =  $(C_1 + C_2x)e^{-3x}$

$$= \frac{1}{D^2 + 6D + 9} \cdot 5e^{3x} = 5 \frac{e^{3x}}{(3)^2 + 6(3) + 9} \\ = \frac{5e^{3x}}{36}$$

b. Solve  $\frac{d^2y}{dx^2} + 9y = \sec 3x$

**Answer**

$$\frac{d^2y}{dx^2} + 9y = \sec 3x$$

Auxiliary equation  $D^2 + 9 = 0$  or  $D = \pm 3i$

C.F. =  $C_1 \cos 3x + C_2 \sin 3x$

$$= \frac{1}{6i} \left[ \frac{1}{D - 3i} - \frac{1}{D + 3i} \right] \cdot \sec 3x \quad (1)$$

$$\text{Now } \frac{1}{D - 3i} \sec 3x = e^{3ix} \int e^{-3ix} \sec 3x dx$$

$$= e^{3ix} \int \frac{\cos 3x - i \sin 3x}{\cos 3x} dx = e^{3ix} \int (1 - i \tan 3x) dx$$

$$= e^{3ix} \left( x + \frac{i}{3} \log \cos 3x \right)$$

Changing I to -I, we have

$$\frac{1}{D+3i} \sec 3x = e^{-3ix} \left( x - \frac{i}{3} \log \cos 3x \right)$$

Putting these values in (i), we get

$$\begin{aligned} \text{P.I.} &= \frac{1}{6i} \left[ e^{3ix} \left( x + \frac{i}{3} \log \cos 3x \right) - e^{-3ix} \left( x - \frac{i}{3} \log \cos 3x \right) \right] \\ &= \frac{x}{6i} e^{3ix} + \frac{\log \cos 3x}{18} - \frac{x}{6i} e^{-3ix} + \frac{e^{-3ix}}{18} \log \cos 3x \\ &= \frac{x}{3} e^{3ix} + \frac{e^{3ix} \log \cos 3x}{18} - \frac{xe^{-3ix}}{6i} + \frac{e^{-3ix}}{18} \log \cos 3x \\ &= \frac{x}{3} \frac{e^{3ix} - e^{-3ix}}{2i} + \frac{1}{9} \cdot \frac{e^{3ix} + e^{-3ix}}{2} \log \cos 3x \\ &= \frac{x}{3} \cdot \frac{e^{3ix} - e^{-3ix}}{2i} + \frac{1}{9} \cdot \frac{e^{3ix} + e^{-3ix}}{2} \log \cos 3x \\ &= \frac{x}{3} \sin 3x + \frac{1}{9} \cdot \cos 3x \cdot \log \cos 3x \end{aligned}$$

Hence, complete solution is  $y = C_1 \cos 3x + \frac{x}{3} \sin 3x + \frac{1}{9} \cdot \cos 3x \cdot \log \cos 3x$

**Q.7** a. Expand  $f(x) = e^x$  in a cosine series over  $(0, 1)$

**Answer**

Here

$$F(x) = x \text{ and } C = 1$$

$$\therefore a_0 = \frac{2}{C} \int_0^c f(x) dx = \frac{2}{1} \int_0^1 e^x dx = 2(e-1)$$

$$\begin{aligned} a_n &= \frac{2}{1} \int_0^1 e^x \cos \frac{n\pi x}{1} dx \\ &= 2 \left[ \frac{e^x}{n^2 \pi^2 + 1} (n\pi \sin n\pi x + \cos n\pi x) \right]_0^1 \end{aligned}$$

$$= 2 \left[ \frac{e^x}{n^2\pi^2+1} (n\pi \sin n\pi + \cos n\pi) - \frac{1}{n^2\pi^2+1} \right]$$

$$= \frac{2}{n^2\pi^2+1} [(-1)^n e - 1]$$

$$\therefore f(x) = \frac{a_0}{2} + a_1 \cos \pi x + a_2 \cos 2\pi x + a_3 \cos 3\pi x + \dots$$

$$e^x = e - 1 + 2 \left[ \frac{-e-1}{\pi^2+1} \cos \pi x + \frac{e-1}{4\pi^2+1} \cos 2\pi x + \frac{-e-1}{9\pi^2+1} \cos 3\pi x + \dots \right]$$

b. Find the Fourier Series of the function

$$f(t) = \begin{cases} 0 & \text{when } -2 < t < -1 \\ K & " \quad -1 < t < 1 \\ 0 & " \quad 1 < t < 2 \end{cases}$$

### Answer

$$2C = 4 \text{ or } C = 2$$

$$a_0 = \frac{1}{C} \int_{-c}^c f(t) dt$$

$$= \frac{1}{2} \int_{-c}^c k dt = \frac{k}{2} (t) \Big|_{-1}^1 = \frac{k}{2} (1 + 1) = k$$

$$a_n = \frac{1}{C} \int_{-c}^c f(t) \cos \frac{n\pi t}{C} dt$$

$$= \frac{1}{2} \int_{-c}^c k \cos \frac{n\pi t}{C} dt$$

$$= \frac{k}{2} \left( \frac{2}{n\pi} \sin \frac{n\pi t}{2} \right) \Big|_{-1}^1$$

$$= \frac{k}{n\pi} \left( \sin \frac{n\pi}{2} - \sin -\left( \frac{n\pi}{2} \right) \right)$$

$$= \frac{2k}{n\pi} \sin \frac{n\pi}{2}$$

$$b_n = \frac{1}{C} \int_{-c}^c f(t) \sin \frac{n\pi t}{C} dt$$

$$\begin{aligned}
 &= \frac{1}{2} \int_{-c}^c k \sin \frac{n\pi t}{2} dt \\
 &= \frac{k}{2} \left[ -\frac{2}{n\pi} \cos \frac{n\pi t}{2} \right]_{-1}^1 = \frac{-k}{n\pi} \left( \cos \frac{n\pi}{2} - \cos \frac{-n\pi}{2} \right) = 0
 \end{aligned}$$

Fourier series is

$$\begin{aligned}
 f(t) &= \frac{a_0}{2} + a_1 \cos \frac{\pi t}{c} + a_2 \cos \frac{2\pi t}{c} + a_3 \cos \frac{3\pi t}{c} + \dots \\
 &\quad + b_1 \sin \frac{\pi t}{c} + b_2 \sin \frac{2\pi t}{c} + b_3 \sin \frac{3\pi t}{c} + \dots \\
 f(t) &= \frac{k}{2} + \frac{2k}{\pi} \left[ \sin \frac{\pi}{2} \cdot \cos \frac{\pi t}{2} + \frac{1}{2} \sin \pi \cdot \cos \frac{2\pi t}{2} + \frac{1}{3} \sin \frac{3\pi}{2} \cdot \cos \frac{3\pi t}{2} + \dots \right] \\
 &= \frac{k}{2} + \frac{2k}{\pi} \left[ \cos \frac{\pi t}{2} - \frac{1}{3} \cos \frac{3\pi t}{2} + \dots \right]
 \end{aligned}$$

**Q.8 a.** Evaluate  $L\{te^{-t} \cosh t\}$

**Answer**

$$\begin{aligned}
 L\{e^{-t} \cosh t\} &= L\left\{e^{-t} \left( \frac{e^t + e^{-t}}{2} \right)\right\} \\
 &= \frac{1}{2} L\{1 + e^{-2t}\} \\
 &= \frac{1}{2} \left( \frac{1}{s} + \frac{1}{s+2} \right) \\
 \therefore (te^{-t} \cosh t) &= -\frac{d}{ds} \left[ \frac{1}{2} \left( \frac{1}{s} + \frac{1}{s+2} \right) \right] \\
 &= -\frac{1}{2} \left[ -\frac{1}{s^2} - \frac{1}{(s+2)^2} \right] \\
 &= \frac{1}{2} \frac{(s+2)^2 + s^2}{s^2(s+2)^2} \\
 &= \frac{s^2 + 2s + 2}{s^2(s+2)^2}
 \end{aligned}$$

b. Evaluate  $L \left\{ \int_0^t \frac{e^t \sin t}{t} dt \right\}$

**Answer**

Here to find  $L \left[ \int_0^t \frac{e^t \sin t}{t} dt \right]$

We have

$$L(\sin t) = \frac{1}{s^2 + 1}$$

$$\therefore L\left(\frac{\sin t}{t}\right) = \int_0^\infty \frac{1}{s^2 + 1}$$

$$= \left[ \tan^{-1} s \right]_0^\infty$$

$$= \frac{\pi}{2} - \tan^{-1} s = \cot^{-1} s$$

$$\therefore L\left(e^t \frac{\sin t}{t}\right) = \cot^{-1}(s-1) = f(s)$$

$$\therefore L\left[\int_0^t e^t \frac{\sin t}{t} dt\right] = \frac{1}{s} f(s)$$

$$= \frac{1}{s} \cot^{-1}(s-1)$$

**Q.9** a. Show that  $L^{-1}\left\{ \frac{s^2}{s^4 + 4a^4} \right\} = \frac{1}{2a} (\cosh at \cdot \sin at + \sinh at \cdot \cos at)$

**Answer**

$$L^{-1}\left\{ \frac{s^2}{s^4 + 4a^4} \right\}$$

$$= L^{-1}\left\{ \frac{s^2}{(s^2 + 2a^2)^2 - 4a^2 s^2} \right\}$$

$$= L^{-1}\left\{ \frac{s^2}{(s^2 + 2a^2)^2 - 4a^2 s^2} \right\}$$

$$= L^{-1}\left\{ \frac{1}{4a} \left( \frac{s}{s^2 + 2a^2 - 4a^2 s^2} \right) - \frac{s}{(s^2 + 2a^2 + 2as)} \right\}$$

Resolving into partial fraction.

$$= \frac{1}{4a} \left[ L^{-1} \left\{ \frac{s}{(s-a)^2 + a^2} \right\} - L^{-1} \left\{ \frac{(s+a)-a}{(s+a)^2 + a^2} \right\} \right]$$

$$= \frac{1}{4a} \left[ L^{-1} \left\{ \frac{(s-a)+a}{(s-a)^2 + a^2} \right\} - L^{-1} \left\{ \frac{(s+a)-a}{(s+a)^2 + a^2} \right\} \right]$$

$$= \frac{1}{4a} \left[ e^{at} \cdot L^{-1} \left\{ \frac{s+a}{s^2 + a^2} \right\} - e^{-at} L^{-1} \left\{ \frac{(s-a)}{s^2 + a^2} \right\} \right]$$

by first shifting theorem.

$$= \frac{1}{4a} \left[ e^{at} \cdot L^{-1} \left\{ \frac{s}{s^2 + a^2} \right\} - a e^{at} L^{-1} \left\{ \frac{1}{s^2 + a^2} \right\} - e^{-at} L^{-1} \left\{ \frac{s}{s^2 + a^2} \right\} \right]$$

$$= \frac{1}{4a} \left[ (e^{at} - e^{-at}) L^{-1} \left\{ \frac{1}{s^2 + a^2} \right\} + a(e^{at} - e^{-at}) L^{-1} \left\{ \frac{1}{s^2 + a^2} \right\} \right]$$

$$= \frac{1}{4a} \left[ (2 \sinh at) \cos at + a(2 \cosh at) \left( \frac{1}{a} \right) \sin at \right]$$

$$= \frac{1}{2a} [\cosh at \cdot \sin at + \sinh at \cdot \cos at] \quad \text{Hence proved}$$

b. Evaluate  $L^{-1} \left\{ \log \frac{s+1}{s-1} \right\}$

### Answer

To evaluate

$$L^{-1} \left\{ \log \frac{s+1}{s-1} \right\}$$

$$\text{Let } L^{-1} \left\{ \log \frac{s+1}{s-1} \right\} = f(t)$$

$$\text{Then } L \{f(t)\} = f(s) = \log \frac{s+1}{s-1}$$

$$\therefore L\{t+(t)\} = (-1) \frac{d}{ds} \left\{ \log \frac{s+1}{s-1} \right\}$$

$$= -\frac{d}{ds} \left\{ \log(s+1) - \log(s-1) \right\}$$

$$= - = - \left[ \frac{1}{s+1} - \frac{1}{s-1} \right]$$

$$= = \frac{1}{s-1} - \frac{1}{s+1}$$

$$= L \{ e^t - e^{-t} \}$$

$$= L \{ 2 \sinh t \}$$

$$\therefore t f(t) = 2 \sinh t$$

$$\text{or } f(t) = \frac{2 \sinh t}{t}$$

$$\text{Hence } L^{-1} \left\{ \log \frac{s+1}{s-1} \right\} = \frac{2 \sinh t}{t}$$
